solving strategies and critical-thinking skills.

National Institutes of Health

About the National Institutes of Health

Founded in 1887, NIH is the federal focal point for basic research and clinical investigators, as well as the myriad professionals in many allied disciplines who support the research enterprise. It is one of the agencies in the Department of Health and Human Services. Its mission is to support the scientific enterprise and to disseminate scientific results so that they can make informed decisions about the nature and behavior of living systems and the application of that knowledge to extend health.

These efforts also help educate people about science in pursuit of fundamental knowledge about the nature and behavior of living systems and the application of that knowledge to extend health. NIH works toward meeting the mission by providing leadership, direction, and education effort. It is a collaboration among the Office of Rare Diseases Research, the NIH Office of Science Education, and Biological Sciences

Curriculum Study.

NIH's education programs contribute to ensuring the continued supply of well-trained
For more about NIH, visit <http://www.nih.gov> .

About the Office of Rare Diseases Research

The Office of Rare Diseases (ORD) was States and several foreign countries working established in 1993 at the National Institutes on about 100 different rare diseases, and is of Health. Later, the ORD's focus on research working to harmonize community efforts on prompted a name change to the Office of Rare patient registries and biospecimen repositories. Diseases Research (ORDR). The ORDR provides A rare disease (also called an "orphan disease") information on rare diseases and rare disease is a condition affecting fewer than 200,000 research; supports scientific conferences; people in the United States (about 1 in 1,500) cosponsors, with the National Human Genome or one affecting more people but "for which Research Institute, the Genetic and Rare no reasonable expectation exists that the costs Diseases Information Center; and coordinates of developing or distributing a drug can be

Introduction to *Rare Diseases*

and Scientific Inquiry

Calling a disease “rare” raises questions. What

2. the process of scientific inquiry through

does it mean to say that a disease is rare? Why

studying rare diseases.

should rare diseases be singled out for special

attention? In the United States, a disease is

The lessons in this supplement help students

considered rare if it affects fewer than 200,000

sharpen their skills in observation, critical

people. Approximately 7,000 rare diseases are

thinking, experimental design, and data

recognized, and researchers continue to describe

analysis. They also make connections to other new ones. Taken together, rare diseases represent disciplines such as English, mathematics, and a significant health concern affecting over social science.

25 million Americans. Like more-common diseases, rare diseases may be caused by gene mutations, infection from pathogens, and exposure to harmful substances in the environment.

As the supplement achieves its objectives, it helps convey to students the purpose of scientific research. Students experience how science provides evidence that can be used to understand and treat human disease. Ongoing common diseases do, they have traditionally research affects how we understand the world been allocated fewer research resources. This around us and gives us the foundation for has made it more difficult for people with rare improving choices about our personal health diseases to obtain accurate diagnoses of their and the health of our community.

conditions. Even with an accurate diagnosis, patients may find that there are no existing

The lessons in this supplement encourage medications or other treatments to help them. students to think about the relationships among People with rare diseases may feel isolated and knowledge, choice, behavior, and human health even stigmatized. Fortunately, during the past in this way:

25 years, increased attention has been devoted **Knowledge (what is known and not known)** to the study of rare diseases, and new treatments + **Choice = Power**

are being developed to help patients. **Power + Behavior = Enhanced Human Health**

What Are the Objectives of the Supplement?

The final objective of this supplement is to *Rare Diseases and Scientific Inquiry* has two encourage students to think in terms of these main objectives: to help students in grades 6–8 relationships now and as they grow older. understand

1. that studying rare diseases is not only

Why Teach the Supplement?

important to the people affected by Middle school life science classes offer an

the diseases, but it also contributes to an ideal setting for integrating many areas of understandings that researchers can apply to student interest. In this supplement, students participate in activities that integrate inquiry, generally, to how the body works and science, human health, mathematics, and

1 science-technology-society relationships. The (National Research Council (NRC), 1996). It real-life context of the supplement's classroom pays particular attention to the standards on lessons is engaging for students, and they can scientific inquiry.

immediately apply what they learn to their lives.

- It is integrated with other subjects, drawing most heavily from science, social science,

What's in It for the Teacher?

mathematics, and health.

Rare Diseases and Scientific Inquiry meets many

- It has a Web-based technology component that of the needs of teachers in modern classrooms: includes interactive activities and simulations.
- The supplement meets science content,

• Finally, the supplement includes built-in teaching, and assessment standards in assessment tools, which we note with an the *National Science Education Standards* assessment icon in each lesson.

Table 1. Correlation of *Rare Diseases and Scientific Inquiry* to Middle School Biology Topics

Topics

Lesson 1

Lesson 2

Lesson 3

Lesson 4

Lesson 5

Important levels of biological organization

include cells, organs, tissues, organ systems, whole organisms, and ecosystems.

Specialized cells carry out specialized functions.

Humans have various body systems including those for digestion, reproduction, circulation, excretion, movement, control and coordination, and protection from disease.

Body systems interact with each other.

Every organism requires a set of

instructions for specifying traits. Heredity is the passage of these instructions from one generation to another.

Hereditary information is contained in genes. An inherited trait of an individual can be determined by one or by many genes. A single gene can influence more than one trait.

The characteristics of an organism can be described in terms of a combination of traits. Some traits are inherited, and others result from interactions with the environment.

Natural environments may contain substances and microbes that are harmful to human beings.

2

Rare Diseases and Scientific Inquiry

In addition, the supplement provides a means problem solve, reason, investigate, and construct for professional development. Teachers can their own meaning for the content.” The use engage in new and different teaching practices of supplemental material like *Rare Diseases and* like those described in this supplement without

Scientific Inquiry can encourage reflection and completely overhauling their entire program. In discussion and stimulate teachers to improve *Designing Professional Development for Teachers* their practices by focusing on student learning *of Science and Mathematics*, S. Loucks-Horsley through inquiry.

and coauthors (1998) write that supplements such as *Rare Diseases and Scientific Inquiry* can A correlation of the supplement’s major “offer a window through which teachers can get concepts with the biology and scientific inquiry a glimpse of what new teaching strategies look topics often included in the middle school life like in action.” By experiencing a short-term science curricula follows (Tables 1 and 2). We supplement like this one, teachers can “change hope this information helps teachers make how they think about teaching and embrace decisions about incorporating this material into new approaches that stimulate students to the curriculum.

Instructional Model

Lesson 1—

Engage

Students may have different ideas about the definition

What Is a Rare

of “disease.” They may also have naïve preconceptions

Disease?

about what makes a disease rare and how rare

diseases are treated, and they may have attitudes

about people with rare diseases.

Lesson 2—

Explore

Diseases have three main causes: genetics,

What Causes Rare

environmental exposure, and infectious agents. These

Diseases?

three influences sometimes interact with each other.

An infectious agent may be able to cause a common

disease in one case and a rare disease in another

case. Doctors must ask testable questions and collect evidence to answer such questions when coming to a diagnosis.

Lesson 3—

Explain

Some rare diseases are inherited. A rare disease may

The Difficulty of

affect multiple body systems. Rare diseases sometimes

Diagnosis

share symptoms with more-common diseases, which

can make getting a proper diagnosis difficult. People

with a rare disease must sometimes cope with a

stigma associated with being different from others.

Lesson 4—

Elaborate

A karyotype can provide evidence that a disease has

The Importance of

a genetic cause. Some genetic diseases are inherited,

Medical Research

while others are not. Much medical information is

available online, but not all of it is useful or reliable.

Clinical trials are an application of the scientific method

to medicine. They have helped improve treatments for

many rare diseases.

rare diseases and their impacts on people's lives may

reduce the stigma sometimes associated with having a

rare disease.

How Does the Supplement Correlate

Research Council's 1996 *National Science*

to the *National Science Education*

Education Standards (NSES). The content of

Standards?

the supplement is explicitly standards based.

Rare Diseases and Scientific Inquiry supports

The following chart (Table 4) lists the specific

teachers in their efforts to reform science

content standards that this supplement

education in the spirit of the National

addresses.

6

Rare Diseases and Scientific Inquiry

Table 4. Alignment of *Rare Diseases and Scientific Inquiry* Lessons with *National*

Science Education Standards for Content, Grades 5–8

Table 4a. NSES Standard A, Science as Inquiry

As a result of activities in grades 5–8, all students should develop

Correlation to *Rare*

Diseases and Scientific

Inquiry Lessons

Abilities necessary to do scientific inquiry

1, 2, 3, 4

- Identify questions that can be answered through scientific investigations.

1, 2, 3, 4

- Design and conduct a scientific investigation. Students should develop 4

general abilities, such as systematic observation, making accurate

measurements, and identifying and controlling variables.

- Use appropriate tools and techniques to gather, analyze, and interpret 2, 3, 4

data.

- Develop descriptions, explanations, predictions, and models using

1, 2, 3, 4

evidence. Students should base their explanations on what they

observed, and as they develop cognitive skills, they should be able to

differentiate explanation from description—providing causes for effects and establishing relationships based on evidence and logical argument.

- Think critically and logically to make the relationships between evidence 2, 3, 4

and explanations.

- Recognize and analyze alternative explanations and predictions.

2, 3, 4

- Communicate scientific procedures and explanations.

2, 3, 4

- Use mathematics in all aspects of scientific inquiry.

3, 4

Understandings about scientific inquiry

2, 3, 4, 5

- Different kinds of questions suggest different kinds of scientific

2, 3, 4

investigations. Some investigations involve observing and describing objects, organisms, or events; some involve collecting specimens; some involve experiments; some involve seeking more information; some involve discovery of new objects and phenomena; and some involve making models.

- Mathematics is important in all aspects of scientific inquiry.

3, 4

- Scientific explanations emphasize evidence, have logically consistent 2, 3, 4, 5 arguments, and use scientific principles, models, and theories.

- ... Asking questions and querying other scientists' explanations is part of 2, 3, 4, 5 scientific inquiry.

Implementing the Supplement

7

Table 4b. NSES Standards C, F, and G, Life Science, Science in Personal and Social Perspectives, and History and Nature of Science

As a result of activities in grades 5–8, all students should develop

Correlation to *Rare*

understanding of

Standard C. Structure and Function in Living Systems

All

- ... Different tissues are ... grouped together to form larger functional

2, 3, 4

units, called organs. Each type of cell, tissue, and organ has a distinct structure and set of functions that serve the organism as a whole.

- The human organism has systems for digestion, respiration, reproduction, 2, 3, 4

circulation, excretion, movement, control, and coordination, and for

protection from disease. These systems interact with each other.

- Disease is a breakdown in structures or functions of an organism.

All

Standard C. Reproduction and Heredity

2, 3, 4

- Every organism requires a set of instructions for specifying its traits. Heredity 2, 3, 4

is the passage of these instructions from one generation to another.

- The characteristics of an organism can be described in terms of a

3, 4

combination of traits. Some are inherited, and others result from

interactions with the environment.

- Hereditary information is contained in genes, located in the

4

chromosomes of each cell. Each gene carries a single unit of

information. An inherited trait of an individual can be determined by

one or by many genes, and a single gene can influence more than

one trait. A human cell contains many thousands of different genes.

Standard F. Personal Health

1, 2, 4

- Natural environments may contain substances (for example, radon and

1, 2, 4

lead) that are harmful to human beings.

Standard F. Risks and Benefits

1, 2, 3, 4

- Students should understand the risks associated with natural hazards

1, 2, 4

(fires, floods, tornadoes, hurricanes, earthquakes, and volcanic

eruptions), with chemical hazards (pollutants in air, water, soil, and

food), biological hazards (pollen, viruses, bacterial, and parasites), social hazards (occupational safety and transportation), and personal hazards

(smoking, dieting, and drinking).

- Individuals can use a systematic approach to thinking critically about 3, 4

risks and benefits.

Standard G. Nature of Science

- Scientists formulate and test their explanations of nature using

2, 3, 4

observation, experiments, and theoretical and mathematical models.

- It is part of scientific inquiry to evaluate the results of scientific 2, 3, 4, 5

investigations, experiments, observations, theoretical models, and the

explanations proposed by other scientists. Evaluation includes reviewing the experimental procedures, examining the evidence, identifying faulty reasoning, pointing out statements that go beyond the evidence, and

suggesting alternative explanations for the same observations.

disease-management options.

5.3 Childhood Leukemia

Leukemias are cancers of the blood or bone marrow that usually result in the overproduction of white blood cells and that are classified by how long it takes for the disease to appear and worsen (acute and chronic) and by the type of blood cell affected (lymphocytic or myeloid):

- Acute leukemia is characterized by the rapid appearance of immature blood cells, called blasts, produced in the bone marrow. This overcrowding of cells prevents the bone marrow from making healthy blood cells. The lack of healthy white blood cells (which help fight infection) leaves the patient vulnerable to repeated bouts of colds and flu. The lack of healthy red blood cells leads to anemia and fatigue. Acute forms of leukemia may occur in people of all ages, but they are often the forms seen in children.

Source: National Marfan Foundation

- Chronic leukemia is characterized by a more

gradual accumulation of relatively mature

blood cells. It may take months or years to

gravely ill people. Rare diseases display the

- *Very Little Is Known about Rare Diseases:* same variations as more-common diseases.

Although limited research has been done Some rare diseases are, in fact, fatal and strike on some rare diseases, others have been their victims during childhood. Others are researched extensively. Especially after the less serious and can be cured or effectively passage of the Orphan Drug Act in 1983, managed.

7.0 Scientific Inquiry

Figure 9. *In the classroom, scientific inquiry can*

Scientific inquiry refers to the diverse ways in which scientists study the natural world and propose explanations based on the evidence derived from their work. Inquiry also refers to the activities of students in which they develop knowledge and understanding of scientific ideas, as well as an understanding of how scientists study the natural world.

Scientific inquiry refers to the diverse ways in which scientists study the natural world and propose explanations based on the evidence derived from their work. Inquiry also refers to the activities of students in which they develop knowledge and understanding of scientific ideas, as well as an understanding of how scientists study the natural world.

7.1 Scientific Inquiry as a Topic for the

Middle School Science Classroom

Scientific inquiry is a topic well suited to the middle school classroom. The *NSES* stress both

Source: Corbis

abilities and understandings about inquiry (NRC, 1996; see Section 7.2 in *Inquiry in the teaching method* (NRC, 1996). To that end, the National Science Education Standards (NRC, content standards for scientific inquiry include 2000)). As discussed in the *NSES*, students are both abilities and understandings about inquiry.

naturally curious about the world. Inquiry-

Table 12. NSES Content Standards for Scientific Inquiry, Grades 5–8

Fundamental Abilities Necessary to Do Scientific Inquiry

- Identify questions that can be answered through scientific investigations.
- Design and conduct a scientific investigation.
- Use appropriate tools and techniques to gather, analyze, and interpret data.
- Develop descriptions, explanations, predictions, and models using evidence.
- Think critically and logically to make the relationships between evidence and explanations.

- Recognize and analyze alternative explanations and predictions.
- Communicate scientific procedures and explanations.
- Use mathematics in all aspects of scientific inquiry.

Fundamental Understandings about Scientific Inquiry

- Different kinds of questions suggest different kinds of scientific investigations.
- Current scientific knowledge and understanding guide scientific investigations.
- Mathematics is important in all aspects of scientific inquiry.
- Technology used to gather data enhances accuracy and allows scientists to analyze and quantify results of investigations.
- Scientific explanations emphasize evidence, have logically consistent arguments, and use scientific principles, models, and theories.
- Science advances through legitimate skepticism.
- Scientific investigations sometimes result in new ideas and phenomena for study, generate new methods or procedures for an investigation, or develop new technologies to improve the collection of data.

36

Rare Diseases and Scientific Inquiry

Glossary

antibiotic: A drug that can kill or inhibit the growth of bacteria. Antibiotics are not effective against viruses.

aorta: The largest artery in the human body. It originates in the left ventricle of the heart and extends down into the abdomen.

asthma: A chronic inflammatory disease of the airways. Its symptoms include wheezing, coughing, and shortness of breath.

biopsy: A medical procedure that involves removing of a small amount of tissue for examination.

The tissue sample is often analyzed by a pathologist to determine the presence or extent of a disease.

bone marrow: Spongy tissue found in the hollow interiors of some large bones. Bone marrow contains stem cells that produce various types of blood cells.

cardiologist: A doctor with specialized training in the prevention, diagnosis, and treatment of diseases

associated with the heart and circulatory system.

central nervous system: That part of the nervous system consisting of the brain and spinal cord.

chromosome: An organized package of DNA found in the nucleus of the cell. Humans have 23 pairs of chromosomes—22 pairs of numbered chromosomes, called autosomes, and one pair of sex chromosomes, X and Y.

clinical trial: A controlled study designed to measure the safety or effectiveness of a new drug or medical procedure.

common disease: A disease that affects a relatively large population. In contrast, a rare disease is defined as one affecting fewer than 200,000 people in the United States.

conjunctivitis: An inflammation of the outermost layer of the eye (also called pinkeye).

The inflammation may be caused by a virus, a bacterium, or an allergic reaction.

connective tissue: A type of tissue that functions to connect other tissues to each other and hold organs in place. The protein collagen is an important structural component of connective tissues.

disease: A condition characterized by the improper functioning of one or more body parts or systems.

The most common causes of diseases are genetic mutation, infection by a pathogen, and exposure to a harmful substance in the environment.

echocardiogram: A medical procedure that uses sound waves to create a moving picture of the heart.

An echocardiogram provides a more detailed view of the heart than an X-ray does, and it doesn't involve exposure to radiation.

Ehlers-Danlos syndrome: A group of inherited diseases of the connective tissue. The syndrome is caused by defects in the collagen protein that result in a variety of symptoms affecting multiple body systems. The condition may be mild or life threatening.

37

genetics: The study of the inheritance patterns of traits. Genetic information is coded in the molecule DNA. Changes to DNA, called mutations, can cause disease.

heart murmur: An extra or unusual sound in the heartbeat. Some heart murmurs are harmless, while others indicate heart problems.

infectious agent: Usually a microscopic agent, such as a virus or bacterium, that can cause an infection and be spread from person to person.

institutional review board: A committee established to approve, monitor, and review medical research involving human subjects.

karyotype: A photograph showing the number and shape of an individual's chromosomes.

leukemia: A cancer of the blood-forming tissues in the bone marrow. Leukemia is often characterized by the production of large numbers of unhealthy white blood cells.

lumbar puncture: A medical procedure also known as a spinal tap. It involves obtaining a small sample of cerebrospinal fluid for analysis. It can be used to look for the presence of an infectious disease such as meningitis or for cancer cells.

Lyme disease: A disease transmitted by a tick bite. Caused by a bacterial infection, Lyme disease is characterized by headaches, fever, depression, and a circular skin rash.

lymph node: A small, spherical organ of the immune system. Lymph nodes are distributed throughout the body and are connected by lymph vessels. They trap bacteria and foreign particles.

Marfan syndrome: A genetic disorder of the connective tissue. Because connective tissue is found throughout the body, features of Marfan syndrome are observed in many different body systems.

medical geneticist: A doctor with specialized training in the diagnosis and treatment of genetic diseases.

methotrexate: A drug used to treat various forms of cancer as well as other diseases. It works against rapidly dividing cells by interfering with the synthesis of DNA, RNA, and protein molecules.

mitral valve prolapse: A heart problem resulting from a faulty valve that separates the upper and lower chambers of the left side of the heart. Symptoms of the condition include chest pain, fatigue, heart palpitations, cough, and shortness of breath after activity.

mutation: A change to the sequence of a DNA molecule. Mutations may be caused by radiation, chemicals, viruses, and mistakes that occur during DNA replication.

myopia: A condition in which the eye focuses incorrectly, making distant objects appear blurred (also called nearsightedness).

necrotizing fasciitis: A rare but very serious bacterial infection that can destroy skin, muscle, and underlying tissues (also called flesh-eating disease). If not treated immediately, it can be fatal.

ophthalmologist: A doctor with specialized training in the diagnosis and treatment of eye problems.

Orphan Drug Act: A piece of federal legislation passed in 1983. It gives pharmaceutical and healthcare companies financial incentives to develop drugs and other products aimed at the treatment of rare diseases.

38

Rare Diseases and Scientific Inquiry

orthopedist: A doctor with specialized surgical training in the treatment of disorders of the skeletal system.

osteogenesis imperfecta: A genetic disease characterized by brittle bones that easily break.

platelet: A type of blood cell produced by the bone marrow. Platelets help blood coagulate in response to damage to the blood vessels.

prednisone: A drug used to treat inflammatory diseases and some forms of cancer. In the treatment of leukemia, prednisone induces cancer cells to commit suicide.

pulmonologist: A doctor with specialized training in the diagnosis and treatment of respiratory diseases.

rare disease: In the United States, a rare disease is one that affects fewer than 200,000 people.

red blood cell: A type of blood cell produced in the bone marrow. Red blood cells are responsible for transporting oxygen to the cells of the body.

Rocky Mountain spotted fever: A disease transmitted by a tick bite. Caused by a bacterial infection, Rocky Mountain spotted fever is characterized by headaches, fever, muscle pain, and skin rash.

scleroderma: A disease of the connective tissue that involves an excessive accumulation of the protein collagen. Because connective tissue is found throughout the body, features of scleroderma are observed in many different body systems.

scoliosis: A medical condition in which a person's spine shows a curve from side to side. Scoliosis may be associated with other diseases, and its symptoms range from mild to severe.

stem cell: A cell with the potential to form many of the different cell types found in the body. When stem cells divide, they can form more stem cells or other cells that perform specialized functions.

stigma: In a social setting, a public disapproval of some personal characteristic or belief that is at odds with the cultural norms.

vincristine: A drug used to treat some forms of cancer. It targets rapidly dividing cells by interfering with the action of a protein needed for cell division.

white blood cell: A type of blood cell produced by the bone marrow. White blood cells are part of the immune system and help protect the body against foreign material and infection by pathogens.

Lesson 1

What Is a Rare Disease?

1

2

Engage

At a Glance

Overview

Lesson 1 asks students to consider their feelings about rare diseases and 3

their attitudes toward people affected by a rare disease. Students are

presented with a fictional scenario in which a reality TV show is thinking about filming a student with a rare disease joining the class. A short list of questions elicits students' preconceptions about disease and its causes.

Students distinguish between diseases that can be cured and those that can be controlled.

Major Concepts

- Diseases have three main causes:

4

- genetics,

- environmental exposure, and

- infectious agents.

- Rare diseases may become common, and common diseases may become rare.

- Some rare diseases can be cured, while many others can be managed through treatment.

- People with a rare disease sometimes must cope with the stigma associated with their condition.

5

45

Objectives

After completing this lesson, students will have

- recorded their preconceptions about the nature of disease and
- considered their feelings about people who are affected by rare diseases.

Teacher Background

Preparation

Each student will need to maintain a notebook or folder dedicated

to this supplement. Most lessons involve handouts and ask students to record information in their notebooks. The lessons also include

opportunities for students to record their initial ideas and answers to questions about rare diseases and scientific inquiry. To help them monitor their own understandings and track how their thinking has changed,

students will frequently refer back to their previous work and their initial understandings. Decide what format will work best for your students. If your students normally use bound composition books, they can continue

to use these and tape or staple handouts into the book. Alternatively, students can use notebook paper for their writing, and then keep their notes and their handouts in binders or folders.

46

Rare Diseases and Scientific Inquiry

Procedure

Activity 1: *What Is a Rare Disease?*

Estimated time: 50 minutes

1

Note: During this lesson, students have an opportunity to express their initial ideas about rare diseases and consider their feelings toward people who are coping with rare diseases. The lesson begins with a reality TV

show scenario where a student with a rare disease is about to join the

class. The aim of this scenario is to bring the idea of rare diseases into students' lives. The intent of the lesson is not to teach content about rare diseases and their causes and management, but rather to elicit students'

prior knowledge about rare diseases. Responses to the questions posed

during the lesson can help you assess students' relative familiarity with the concepts and identify misconceptions. Intended to be brief, this

initial assessment of preconceptions can help you adjust your teaching of 2

Lessons 2 through 5.

1.

Begin the lesson by explaining that you have received a letter from a television producer asking for help with a new reality TV show his production company is developing.

2.

Display Master 1.1, *Letter from a Producer*. Ask for a volunteer to read the letter aloud to the class.

The letter explains that a proposed reality TV show will take place in a middle school and involve a class that includes one student

3

who has a rare disease. The show will give viewers an idea of how this student interacts with teachers and other students. The specific nature of the disease has not yet been decided.

3.

Further explain that the principal has asked your class to help with the producer's request. Ask,

• **“How would you feel about having such a student join the class?”**

• **“What questions would you want to ask before the student arrives?”**

• **“What questions would you want to ask the student who has**

4

the rare disease?”

Write these three questions on the board.

4.

Instruct students to record these questions and their answers to them in their notebooks. They should also record any feelings they have about the student joining their class.

This step is intended to have students briefly record their initial feelings about people with rare diseases and to elicit any questions

5

Lesson 1

47

or concerns they might have. Give students about five minutes to complete this task.

5.

After students have recorded their thoughts and questions, ask for one or two volunteers to share something they wrote in their

notebooks.

At this time, accept all answers. Do not attempt to answer the

Students' responses

students' questions or make judgments about their feelings.

to these questions

6.

Comment that the feelings expressed and the questions asked

will help you assess

are understandable and that students will be learning about

rare diseases during the remainder of this lesson and in the four

toward rare diseases

lessons that follow.

and those affected by

7.

Explain that you will begin by exploring what the word "disease"

them.

means to them. Give each student a copy of Master 1.2,

***Thinking about Disease.* Instruct students to answer the questions and carry out the task described on the handout.**

Explain that this handout is not meant to be a test. Instead,

it is designed to help students organize their thinking about

disease. Students' responses to the handout will identify their

preconceptions about disease. Give students about 10 minutes to

complete the handout.

Note: Students may ask questions that, although good, address issues that interrupt the flow of the

lesson. One strategy for honoring such questions is to establish a “parking lot” on a piece of chart paper or the board. One half of the parking lot is labeled “unanswered” and the other half is labeled “answered.”

Questions that are best answered at a later time are written on sticky notes and placed in the “unanswered” column. As questions are addressed in the activities, move the sticky notes to the answered side of the parking lot.

8.

After students have completed Master 1.2, ask for volunteers to share their responses to Questions 1–3.

Answer key for questions on Master 1.2, *Thinking about Disease*

Content Standard C:

Disease is a

1. What is a disease?

breakdown in

Many students will respond that a disease is a sickness that results structures or functions from an infectious agent such as a germ, bacterium, or virus. If

of an organism. Some

other causes such genetics or exposure to environmental toxins are

diseases are the result

not mentioned, do not be concerned. These other disease causes will be brought out in Question 3 and in the next lesson.

of intrinsic failures of

the system. Others are

2. How do doctors tell whether someone has a disease?

the result of damage

Students will likely think of blood or other types of laboratory tests.

by infection by other

This question also provides an opportunity to discuss different types organisms.

of disease symptoms such as fever, pain, and skin rashes.

48

Rare Diseases and Scientific Inquiry

Ask students to describe how the doctor can observe or measure these symptoms.

3. What do you think causes disease?

Again, students likely will mention infectious agents. If they don't mention other causes, challenge them to think of a disease caused

by something other than an infectious agent. If necessary, ask

1

guiding questions to bring out the ideas that heredity and exposure to toxic substances in the environment are also causes.

9.

Ask students to report some of the diseases they listed for

Question 4 on the handout. As they respond, record and display

for the class a list of about 20 diseases. After the list is assembled, ask students to think about the causes of these diseases and

whether there are ways to group these diseases based on their

causes. Instruct students to organize the 20 diseases in their

notebooks in a way that illustrates the different causes.

2

Students may elect to make a table with the columns corresponding

to different causes and the rows corresponding to disease examples.

Some students may be concerned that a given disease could have or be influenced by more than one cause. Ask these students to consider using a graphical representation such a Venn diagram to illustrate these interactions.

Students may have listed diseases for which they don't know the causes. This is understandable. The important part of this exercise is not to compile a lengthy list of diseases and their causes but

3

rather to give students a chance to express their preconceptions about diseases and their causes. If students ask you what causes a particular disease and you know the cause, tell them so they can classify it. If you don't know the cause of the disease, instruct the student to put a question mark next to the disease and not to worry about classifying it by its cause.

Note: You may want to assign Step 9 (causes-of-disease organizer) as homework.

The manner in which

4

initial ideas about

diseases and their

Ask questions to clarify students' thinking, but do not correct

causes and to identify

misconceptions at this time. The three main causes of disease

(infectious agents, heredity or genetics, and exposure to

misconceptions the

environmental toxins) will be addressed in the subsequent lessons.

student may have.

5

Lesson 1

49

Environmental exposure may be somewhat confusing. One can

argue that a disease brought about by exposure to a pathogen is

environmental since the pathogen is found in the environment. For

our purpose, a disease caused by environmental exposure refers to a

nonliving agent such as radiation, heavy metals, or a toxin produced

by another organism.

11. Ask for volunteers to share their responses to Question 5.

5. What does it mean to call a disease "rare"?

Students' responses will vary. If students struggle with this question, rephrase it by asking whether some diseases affect more people

than others. You may mention that in this country, a disease is

considered to be rare if 200,000 people or fewer have it. To help students make some sense of this number, you can mention that the U.S. population was about 311 million people in 2011.

12. Ask, “Do you think that a disease that is rare always remains rare? Can a rare disease become a common disease?”

Students’ responses will vary. If students don’t bring it up, ask guiding questions to bring out the idea of a new infectious disease such as swine flu that begins as a rare disease and then becomes common as it spreads.

13. Ask, “Can a common disease become a rare disease?”

If a student doesn’t mention this, direct the discussion to medicine’s ability to control or even eradicate some diseases. You may mention polio as an example of a disease that was once common but is now rare. Smallpox has actually been extinguished.

14. Ask for volunteers to share their responses to Question 6 (whether the diseases they listed are curable, controllable, or not controllable).

For many diseases on their lists, students will not be able to say whether they are curable, controllable, or not controllable. Bring out in the discussion examples of diseases that are curable, such as many bacterial infections, and others that are controllable, such as diabetes.

15. Explain that some diseases are relatively easy to treat and others are more difficult. Ask, “What are some reasons that one disease might be more difficult to treat than another?”

Students may focus on specific diseases. Try to get them to speak in

general terms to address issues such as the amount of information

50

Rare Diseases and Scientific Inquiry

known about the disease, the ease of diagnosis, and the amount of resources that society devotes to the study and treatment of the disease.

Remind students to return Master 1.2 to their notebooks. They will revisit the ideas they recorded on the handout in a later lesson.

1

16. Conclude the lesson by remarking that the lessons that follow will give students opportunities to reflect on the ideas brought out during this lesson and to modify their thinking if necessary.

Rare Diseases and Scientific Inquiry

Lesson 2

What Causes Rare Diseases?

1

2

Explore

At a Glance

Overview

In this lesson, students assume the roles of medical officers working to protect the health of soldiers at an army post. In the course of their duties, **3**

they must consider the major causes of disease and pay special attention to infectious diseases that have the potential to spread throughout the post. One soldier becomes infected with a common bacterial species that leads to the development of a serious rare disease.

Major Concepts

- Diseases have three main causes:
 - genetics,
 - environmental exposure, and
 - infectious agents.

4

- A bacterial species that causes a common disease can sometimes cause a rare disease.
- Disease causes sometimes interact.

Objectives

After completing this lesson, students will have

- considered the different causes of disease,
- recognized that a single species of pathogen can cause two different diseases depending on the route of infection, and
- discussed an example of how two different disease causes (infection and genetics) can interact to produce a rare disease.

5

Note on page 62.)

Activity 3: How Rare Is Rare?

None

Continued

54

Rare Diseases and Scientific Inquiry

Equipment and Materials

For Activities 1 and 2, Web-based versions, students will need computers with Internet access.

For Activity 3, you will need baby lima beans for each group of four students:

1

- 1 small container with 9 beans and 1 bean colored red and
- 1 large container with 99 beans and 1 bean colored red.

Preparation

Activity 1

Make photocopies and a transparency.

For classes using the Web version, verify that the computer lab

is reserved for your classes or that the classroom computers are set up for the activities. Refer to Using the Web Site for

2

details about the Web site. Check that the Internet connection is working properly.

Log on to the Web Portion of Student Activities section of the site at

<http://science.education.nih.gov/supplements/rarediseases/student>

Select “Lesson 2: What Causes Rare Diseases?” so students can begin the activity right away.

3

Activity 2

Review the photos of the necrotizing fasciitis (NF) patient on Master 2.6, *Medical Reference Manual: Necrotizing Fasciitis*. **If the photo of the late-stage infection is too graphic for your students, block it out before copying.** Make photocopies.

Activity 3

Each group of four students will need

- 1 small container with 9 baby lima beans and 1 bean colored red (use a marking pen) and

4

- 1 large container with 99 baby lima beans and 1 bean colored red (use a marking pen).

It will save time if you weigh the beans rather than count them. There are approximately 100 baby lima beans per 1.33 ounces (37.7 grams).

5

Lesson 2

55

Procedure

Note: This is an Explore lesson. It is designed to give students a common experience they can use to begin constructing understandings about rare diseases and their causes. In this lesson, students assume the roles of medical officers at an army post. This scenario gives students a real-life context in which to

consider genetics, infectious agents, and environmental exposure as the major causes of disease. The lesson focuses on the rare disease necrotizing fasciitis (NF), more commonly known as flesh-eating disease. The serious nature of this disease may be disturbing to some students. The lesson stresses that although NF is caused by a commonly encountered bacterium, the immune system normally stops the infection before it becomes dangerous.

In rare cases (about 1 in 100,000 people), the bacteria elude the immune system and the infection can lead to organ failure and death. The hands-on probability activity is included to help make the rarity of the disease more understandable and thus reduce any student anxiety.

Activity 1: *Causes of Disease*

Estimated time: 30 minutes

1.

Explain that in this lesson, you will be concerned with this

question: What causes rare diseases?

Display this question for the class. Students should recall some causes of disease from the first lesson. In Step 8, you may need to remind students that there are three general causes of disease: infectious agents, heredity (genetics), and exposure to toxins in the environment.

2.

Open the activity by explaining that students will assume the roles of medical officers who are in charge of looking after the health of soldiers at an army post. The post is where new recruits are trained.

If necessary, explain to students that an army post is where soldiers are stationed. The soldiers live and sleep in close quarters called barracks, which are like dormitories. When they are sick or injured, soldiers visit a clinic called an infirmary.

3.

Arrange the students in pairs. Explain that their task as medical

officers is to examine the list of all visits to the infirmary during the previous week. They are looking for any patterns that

would indicate a health concern on the post.

For example, students should be on the lookout for any clusters of

illness or accidents that may represent a larger threat to the soldiers and limit the ability of the army post to meet its responsibilities.

56

Rare Diseases and Scientific Inquiry

(For print version, skip to Step 4-p below.)

In classrooms using the Web version of this activity:

4a-w. Give each student pair a copy of Master 2.1, *Medical Officer*

***Report Form*. Explain that students will add information to the 1**

form by accessing medical information on the post's Web site.

4b-w. Instruct student pairs to proceed to

<http://science.education.nih.gov/supplements/rarediseases/>

student

Students should click on “Lesson 2: What Causes Rare Diseases?”

and then “Activity 1: Infirmary Visits, Week 1.”

5a-w. Instruct students to look over the reasons that each soldier

2

went to the infirmary and to think about the nature of the causes of the soldiers' complaints.

Students can sort the patients by their patient number, location (the barracks they live in), and medical complaint. This step should take no more than about five minutes.

5b-w. After students have had a chance to look over the information on the New Visits to the Infirmary, Week 1, table ask, "What are

two general reasons why soldiers reported to the infirmary?"

3

Students may want to respond by citing specific complaints. At this point, simply direct the discussion to bring out the fact that soldiers reporting to the infirmary were either sick or injured.

Continue with Step 6 on page 58.

In classrooms using the print version of this activity:

4-p. Give each student pair one copy each of Master 2.1,

4

Medical Officer Report Form, and Master 2.2, Visits to

the Infirmary, Week 1. Instruct students to look over the reasons that each soldier went to the infirmary and to think

about the nature of the causes of the soldiers' complaints.

This step should take no more than about five minutes.

5-p. After students have had a chance to look over the information in Master 2.2, ask, "What are two general reasons why soldiers

reported to the infirmary?"

5

Students may want to respond by citing specific complaints listed on the handout. At this point, simply direct the discussion to bring out the fact that soldiers reporting to the infirmary were either sick or injured.

6.

Acknowledge that soldiers may become injured for many different reasons. Ask, “What about sickness?” Remind the students that in Lesson 1, they came up with three general causes of disease: infectious agents, heredity (genetics), and exposure to environmental toxins. Ask, “Which of these three causes is most likely to be responsible for a health problem that can spread throughout the post?”

Students should recognize that a disease caused by an infectious agent is the most likely to spread throughout the post.

7.

Display Master 2.1. Ask for a volunteer to summarize the reasons that soldiers came to the infirmary.

Content Standard C:

Display the responses as you list them. Guide the discussion to Disease is a focus on the following:

breakdown in

• Barracks A has a cluster of six soldiers complaining of sore, itchy

structures or functions

eyes.

of an organism. Some

• Barracks G has a cluster of six soldiers complaining of sore throat.

diseases are the result

• Barracks E has two soldiers with a skin rash.

• Four soldiers from three different barracks have sore toes from

of intrinsic failures of

wearing new boots.

the system. Others are

• One soldier has a cut on the leg.

the result of damage

• One soldier complains of shortness of breath.

by infection by other

• One soldier twisted his ankle.

organisms.

Content Standard F:

8.

Remind students that they need to look for potential health

threats to the post. Ask, “Do you see any patterns or cases that

Natural environments

worry you?”

may contain

substances (for

Students should respond that the clusters of sore, itchy eyes; sore example, radon and throats; and skin rashes could each potentially spread to other lead) that are harmful soldiers on the post. Students may also mention the soldier in to human beings.

Barracks I who complained of shortness of breath. The other soldiers visiting the infirmary have problems that probably won't spread.

9.

Mention that it is possible that one or more types of infectious disease may be present on the post. Ask, "How can we tell whether or not a soldier has a bacterial infection?"

Students' responses will vary. They may mention other symptoms such as mucous discharge or running a fever. If not mentioned by

58

Rare Diseases and Scientific Inquiry

a student, turn the discussion to laboratory tests. Students may first think of a blood test. Explain that doctors can obtain a swab from a

patient's throat or other part of the body and test it for the presence of infectious bacteria.

10. Explain that as medical officers, they have the ability to test for the presence of different species of bacteria that had previously

1

infected soldiers on the post. Two different tests can be ordered:

- **Test 1: Looks for infection by bacterial species A, B, and C.**

These species are associated with common infections for pinkeye and sore throats as well as infections resulting from cuts and abrasions.

- **Test 2: Looks for bacterial infections associated with skin rashes caused by Rocky Mountain spotted fever or Lyme disease. Test 2 also looks for exposure to poison ivy (not caused by bacteria).**

2

Note: While it is true that medical tests sometimes look for multiple causes at the same time, the tests described in this activity were created to make the test-ordering procedure easy for students to carry out.

(For print version, skip to Step 11-p on page 60.)

In classrooms using the Web version of this activity:

11-w. Instruct students to return to the Web site in their pairs and select the lab tests (if any) to perform on the soldiers. After

making their selections, students should summarize on

3

Master 2.1 which tests they ordered, which soldiers were tested, and why they ordered each test. Conduct a brief discussion to reach a consensus about which tests (if any) should be ordered and for whom.

Since the exact causes of the soldiers' illnesses are not known,

students should decide to test the soldiers with eye redness and sore throats with Test 1, which looks for infection by bacterial species A, B, and C.

4

Soldiers with skin rashes should be tested using Test 2, which looks for infection by the bacteria associated with Rocky Mountain spotted fever and Lyme disease as well as exposure to poison ivy. Students may decide not to perform tests on the soldiers complaining of sore toes. Explain that such foot blisters can become infected and suggest that they, too, be tested for possible infection using Test 1 (infection by bacterial species A, B, and C).

Some students may want to play it safe and order both tests for each soldier. Make it clear that tests come with costs, and the

5

Lesson 2

59

infirmary must perform efficiently. Therefore, only needed tests should be ordered.

Note: Pinkeye (conjunctivitis) can either be contagious or not. The contagious form of the disease is caused by a bacterial or a viral

infection. A number of different bacterial species can cause a pinkeye infection.

12-w. Instruct student pairs to return to the Web site and click on

“Activity 1: Lab Test Results.”

The table that appears contains the same information about soldiers visiting the infirmary that is in “Activity 1: Infirmary

Visits, Week 1.” It also lists which lab tests were ordered, the lab test results, the patient diagnosis, and the patient treatment.

13-w. Instruct students to briefly summarize in their notebooks those cases with the potential to spread throughout the army post. Also ask them to describe how the cases were treated.

Students need not list information about each soldier. Instead, they can describe groups of soldiers with similar complaints and test results.

End of Web-based activity.

In classrooms using the print version of this activity:

11-p. Instruct student pairs to decide which lab tests (if any) to perform on which soldiers. Groups should summarize on Master 2.1 which tests they ordered, which soldiers were tested, and why they ordered each test.

Conduct a brief discussion to reach a consensus about which tests (if any) should be ordered and for whom.

Since the exact causes of the soldiers’ illnesses are not known, students should decide to test the soldiers with eye redness and sore throats with Test 1, which looks for infection by bacterial species A, B, and C.

Soldiers with skin rashes should be tested using Test 2, which looks for infection by the bacteria associated with Rocky Mountain spotted fever and Lyme disease as well as exposure to poison ivy. Students may decide not to perform tests on the soldiers complaining of sore toes. Explain that such foot blisters can become

infected and suggest that they, too, be tested for possible infection

using Test 1 (infection by bacterial species A, B, and C).

60

Rare Diseases and Scientific Inquiry

Some students may want to play it safe and order all tests for each soldier. Make it clear that tests come with costs, and the infirmary must perform efficiently. Therefore, only needed tests should be ordered.

Note: Pinkeye (conjunctivitis) can either be contagious or not. The contagious form of the disease is caused by a bacterial or a viral infection.

1

A number of different bacterial species can cause a pinkeye infection.

12-p. Give each student pair one copy of Master 2.3, *Test Results*,

Week 1.

This handout contains the same information about soldiers visiting the infirmary that was found on Master 2.2. It also lists which lab tests were ordered, the lab test results, the patient diagnosis, and the patient treatment.

13-p. Instruct students to briefly summarize in their notebooks those 2

cases with the potential to spread throughout the army post and

to describe how they were treated.

Students need not list information about each soldier. Instead, they can describe groups of soldiers with similar complaints and test results.

Activity 2: *Is a Rare Disease Present?*

Estimated time: 40 minutes

3

(For print version, skip to Step 1-p on page 62.)

In classrooms using the Web version of this activity:

Note: In Step 9 of this activity, students access a medical reference manual that contains two images of a patient with flesh-eating disease. One of the images is rather graphic and may be disturbing to some students. We recommend that you view the images before class and decide whether

you want students to see them. If you decide not to let students see them, instead of using the Web site for this step, give each student pair one copy **4**

of Master 2.6, *Medical Reference Manual*, on which you have blocked out the photos.

1-w. Keep the students in pairs. Explain that one week has gone by, and you are ready to discuss the patient outcomes from that

week. You are also going to present a list of new visits to the

post's infirmary.

2-w. Instruct students to proceed to

<http://science.education.nih.gov/supplements/rarediseases/>

student

5

Lesson 2

61

Students should click on “Lesson 2: What Causes Rare

Diseases?” and then “Activity 2: Follow-up on Week 1 Visits.”

After students have had a chance to look over the information

in the table, ask for volunteers to summarize what they

learned about the treatment outcomes of the Week 1 infirmary

visits.

The cases of pinkeye, sore throat, skin rash, and asthma have responded (or are responding) to treatment. Cases of sore toes and injuries were treated, but it is too soon to describe outcomes.

3-w. Ask, “Did you learn anything that causes you to be concerned?”

Many students will probably note that the treatments are working and will, therefore, express no particular concerns. Some students may be concerned that two of the six soldiers being treated for sore throats returned to the infirmary. Others may note that three of the four soldiers who developed blisters on their feet tested positive for infection by bacterial species A.

4-w. Instruct students to click on “Activity 2: Infirmary Visits, Week 2.” As before, instruct students to reflect on the information and summarize in their notebooks the soldiers’ reasons for coming to the infirmary.

This step should take no more than about five minutes.

Continue with Step 5 on page 63.

In classrooms using the print version of the activity:

Note: In Step 9-p, student pairs get a copy of Master 2.6, which contains two images of a patient with flesh-eating disease. One

of the images is rather graphic and may be disturbing to some

students. We recommend that you view the images before class and decide whether you want students to see them. If not, block out the images on

Master 2.6 before making copies.

1-p. Keep the students in their pairs. Explain that one week has

gone by and you are ready to discuss the patient outcomes from that week. You are also going to present a list of new visits to the post's infirmary.

2-p. Give each student pair one copy of Master 2.4, *Follow-up on Week 1 Infirmary Visits*.

62

Rare Diseases and Scientific Inquiry

3-p. After groups have had a chance to look over Master 2.4, ask, “Did you learn anything that causes you to be concerned?”

Many students will probably note that the treatments are working and will, therefore, express no particular concerns. Some students may be concerned that two of the six soldiers being treated for sore throat returned to the infirmary. Others may note that three of the

1

four soldiers who developed blisters on their feet tested positive for infection by bacterial species A.

4-p. Give each pair one copy of Master 2.5, *Visits to the Infirmary*,

Week 2. As before, instruct students to reflect on the information on the handout and to summarize, in their

notebooks, the soldiers’ reasons for coming to the infirmary.

This step should take no more than about five minutes.

2

5.

Ask for volunteers to summarize the information they recorded in their notebooks.

Display students’ responses as you list them. Guide the discussion to focus on the following:

Some soldiers who visited the infirmary during Week 1 returned.

- Two soldiers from Barracks G who reported to the infirmary during the first week complaining of sore throat returned with similar complaints.

3

- One of the soldiers with a sore toe has developed a severe infection from bacterial species A.

Most soldiers who visited the infirmary were first-time patients.

- Four soldiers from Barracks G appeared complaining of sore throat.
- Two soldiers from Barracks A appeared complaining of sore throat.
- Two soldiers (from Barracks B and F) appeared complaining of skin rashes.
- One soldier appeared with a cut on the head.

4

- One soldier appeared with an injured ankle.
- One soldier appeared with a sore toe.

6.

Remind students that you are concerned about infectious diseases that might spread to the rest of the post. Ask, “Is there any evidence of a bacterial infection spreading throughout the post?”

Students may observe that the infection with bacterial species C that caused the pinkeye is under control and not cause for concern. They should also observe that new cases of infection by bacterial species

5

Lesson 2

A are sending soldiers from other barracks to the infirmary with sore throats. Some will likely report that this is a cause for concern.

Finally, some students may note that bacterial species A is also responsible for a severe foot infection in one soldier who developed a blister from wearing new boots.

7.

Explain that you are concerned about the foot infection that has quickly become serious. Observe that bacterial species A seems to be responsible for two different diseases: the inflammation of the throat seen in many soldiers and the severe foot infection in one soldier. Ask, “Can the same bacterial species be responsible for causing two different diseases?”

Students will probably not be able to give a knowledgeable answer to this question. Guide the discussion to bring out the possibility

that the same bacteria infecting different parts of the body might produce different symptoms.

8.

Acknowledge that it is difficult to know whether bacterial species A can cause two very different-looking diseases. Explain that the severe foot infection could be due to flesh-eating disease, which is very rare though very serious. Suggest that

Content Standard A:

some research may help discover whether there is a possible

Scientific explanations

link between bacterial species A and flesh-eating disease.

Explain that students can look up flesh-eating disease in the

evidence to support a

scientific explanation.

Give students about 10 minutes to complete the tasks.

64

Rare Diseases and Scientific Inquiry

10. After students have completed the tasks, ask for volunteers to report answers to each question on Master 2.7.

Answer key for Master 2.7, *Questions about a Rare Disease*

1. What evidence suggests that bacterial species A causes both sore throat and foot infection?

1

• *Bacterial species A was cultured from throat swabs of soldiers with sore throats and from toe swabs of three out of four soldiers who developed blisters from wearing new boots.*

- *The Medical Reference Manual mentions that flesh-eating disease can be caused by different species of bacteria, including the one that causes strep throat.*

2. What evidence suggests that the soldier with the foot infection has flesh-eating disease?

- *A toe swab tested positive for bacterial species A.*

2

- *The symptoms (redness, swelling, and nausea) are consistent with flesh-eating disease, as is the timeline (symptoms progressing quickly).*

3. Why are there many cases of sore throat but only one case of flesh-eating disease?

- *Sore throats can spread among soldiers living together.*

- *Flesh-eating disease generally doesn't spread because it requires contact with an open wound.*

4. What evidence is there that flesh-eating disease is a rare disease?

3

- *The Medical Reference Manual states that it is rare disease.*

The odds of getting it are about 1 in 100,000.

- *Three soldiers with foot blisters tested positive for bacterial species A, but only one soldier developed flesh-eating disease.*

5. What should be the next step in treating the soldier with the foot infection? Explain your reasoning.

- *The soldier should be sent immediately to a hospital with the*

resources needed to treat flesh-eating disease. The disease is very serious. According to the Medical Reference Manual, 2 out 10

4

patients die from it.

Activity 3: How Rare Is Rare?

Estimated time: 30 minutes

Note: The purpose of this activity is to make the 1 in 100,000 probability of coming down with flesh-eating disease more real to the class. It is not important that the students understand how the probability calculation is performed.

5

Lesson 2

65

1.

Observe that we all come into contact with bacterial species A and that it causes the common disease of strep throat. As this lesson shows, sometimes a bacterium associated with a common disease can also cause a rare disease. Explain that although this lesson dealt with a person who developed flesh-eating disease, the rate of this infection is actually quite low. The odds of coming down with flesh-eating disease are about 1 in 100,000.

2.

Explain that you will finish the lesson by performing a brief demonstration of the rarity of coming down with flesh-eating disease. Arrange the class in groups of four students. Give each

group

- **1 small container containing 9 baby lima beans and 1 baby**

Content Standard A:

lima bean that has been colored red and

- **1 large container containing 99 baby lima beans and 1 baby**

Mathematics is

lima bean that has been colored red.

important in all

aspects of scientific

3.

Display this statement: “The odds of coming down with

inquiry.

flesh-eating disease this year are 1 in 100,000.”

4.

Explain that you will now explore that statement. Explain

that a bean colored red represents a person who *may* come down with flesh-eating disease.

Instruct one student from each

group to close his or her eyes and select 1 bean from the small

container of 10 beans.

- **Ask, “Did anyone get a red bean?”**

Selecting the red bean means that the student *may* come down with flesh-eating disease.

5.

Display this below the statement about probability: “1/10.”

Explain that the odds of picking a red bean from the small

container were 1 in 10.

- **If a student has selected the red bean, explain that it doesn’t**

mean the student will get flesh-eating disease but rather that the possibility still exists.

- If no one selected a red bean, produce one yourself and explain that this represents the possibility that an individual will come down with flesh-eating disease.

6.

Instruct another student from each group to select a bean from the large container without looking.

- Ask, “Did anyone get a red bean?”

Most likely, no one will have picked a red bean.

7.

Display this next to the “1/10”: “ $\times 1/100$.” Explain that the odds of picking a red bean from the large container were 1 in 100.

66

Rare Diseases and Scientific Inquiry

- If a student has selected the red bean, explain that, as before, it doesn’t mean that the student will get flesh-eating disease but rather that the possibility still exists.

- If no one selected a red bean, produce one yourself and explain that this represents the possibility that an individual will come down with flesh-eating disease.

1

8.

Instruct students to put the bean they selected back into the large container and remix the beans.

9.

One last time, instruct another student from each group to select a bean from the large container without looking.

- Ask, “Did anyone get a red bean?”

As before, it is unlikely that a student will have picked a red bean.

10. Display this next to the “1/100”: “ $\times 1/100$.” Explain that, just 2 as last time, the odds of picking a red bean from the large container were 1 in 100.

11. Explain that this activity modeled the 1 in 100,000 probability of coming down with flesh-eating disease. Display the answer to

the probability calculation:

$$1/10 \times 1/100 \times 1/100 = 1/100,000$$

12. Summarize by explaining that to reach the 1/100,000 odds of coming down with flesh-eating disease, a group would have had

3

to pick the red bean from the small container and pick it again

both times from the large container.

Note: Some students may wonder what it would look like to pick one red baby lima bean out of a pile of 100,000 beans. You may explain that 100,000 baby lima beans would weigh about 83 pounds and fill a large

wheelbarrow.

13. Conclude the lesson by asking,

- “What are two reasons why flesh-eating disease is so rare?”

4

- “Which two general causes of disease interacted to allow flesh-eating disease to develop?”

Students should comment that the bacteria responsible for flesh-

eating disease are normally found in the throat and airways, but in

the case of flesh-eating disease, the bacteria enter another part of the body through an open wound.

5

Lesson 2

67

If not brought up by a student, mention that the vast majority of people don't develop flesh-eating disease even when infected through an open wound. Most people's immune systems stop the infection; but in rare cases, a person has an immune system that (because of genetics) allows the infection to become established.

Also, people with weakened immune systems are at higher risk for infection.

68

Rare Diseases and Scientific Inquiry

Lesson 2 Organizer: Web Version

Activity 1: *Causes of Disease*

Estimated time: 30 minutes

Page and Step

1

Explain that students will explore what causes rare diseases and assume the Page 56 roles of medical officers in charge of the health of soldiers at an army post.

Steps 1 and 2

Arrange the class into pairs. Explain that they will look at a list of

Page 56

infirmary visits for the previous week and look for patterns that suggest Step 3 a health concern.

Give each pair a copy of Master 2.1, and instruct pairs to go to the Page 57

Web site for the curriculum.

Step 4-w

Instruct students to click on “Activity 1: Infirmary Visits, Week 1” and to Page 57 think about the reasons why soldiers went to the infirmary.

Step 5a-w

2

Ask, “What are two general reasons why soldiers reported to the

Page 57

infirmary?”

Step 5b-w

Remind students about the three general causes of disease:

Page 58

- **infectious agents,**

Step 6

- **heredity (genetics), and**

- **environmental toxins.**

Ask, “Which of these three causes is most likely to be responsible for a health problem that can spread throughout the post?”

3

Display Master 2.1.

Page 58

- **Ask for a volunteer to summarize the reasons that soldiers came**

Steps 7

to the infirmary.

and 8

- **Record and display these reasons.**

- **Ask, “Do any patterns or cases worry you?”**

Mention that one or more types of infectious disease may be present

Page 58

on the post. Ask, “How can we tell whether or not a soldier has a

Step 9

bacterial infection?”

Explain that they can order tests for bacterial infections.

Page 59

4

• Test 1 looks for infections by bacterial species associated with

Step 10

pinkeye, sore throats, and infected cuts and abrasions.

• Test 2 looks for infections associated with skin rashes caused by

Rocky Mountain spotted fever or Lyme disease bacteria and for

exposure to poison ivy.

Instruct pairs to return to the Web site, order the needed tests, and

Page 59

record on Master 2.1 which tests they ordered and why.

Step 11-w

Ask students to click on “Activity 1: Lab Test Results.” Tell students

Page 60

to summarize in their notebooks those cases that could spread

Steps 12-w

throughout the post and to describe how they were treated.

and 13-w

5

Lesson 2

69

Activity 2: *Is a Rare Disease Present?*

Estimated time: 40 minutes

Page and Step

Explain that one week has gone by, and you are ready to discuss

Page 61

patient outcomes from Week 1.

Steps 1-w

- Instruct pairs to go the Web site and click on “Activity 2: Follow-up and 2-w on Week 1 Visits.”**
- Ask volunteers to summarize the outcomes described there.**

Ask, “Did you learn anything that causes you to be concerned?”

Page 62

Step 3-w

Instruct pairs to click on “Activity 2: Infirmary Visits, Week 2” and then Page 62 to summarize in their notebooks the reasons soldiers came to the

Step 4-w

infirmary.

Ask volunteers to report what they wrote in their notebooks, display

Page 63

their responses, and discuss.

Step 5

Ask, “Is there any evidence of a bacterial infection spreading

Page 63

throughout the post?”

Step 6

Explain that you are concerned about the serious foot infection.

Page 64

• Observe that bacterial species A seems to cause both sore throats

Step 7

and the foot infection.

• Ask, “Can the same bacterial species be responsible for causing

two different diseases?”

Explain that the foot infection could be caused by flesh-eating disease.

Page 64

Instruct students to look up the disease in the Medical Reference

Step 8

Manual.

Give each pair a copy of Master 2.7 . Instruct students to go to the Page 64

Web site, click on “Activity 2: Medical Reference Manual,” and use the

Step 9-w

information there to answer the questions on Master 2.7.

Ask volunteers to report their answers to the questions

Page 65

on Master 2.7.

Step 10

70

Rare Diseases and Scientific Inquiry

Activity 3: *How Rare Is Rare?*

Estimated time: 30 minutes

Page and Step

Observe that bacterial species A is common and causes strep throat. It

Page 66

can also cause the rare flesh-eating disease. Explain that the odds of

Step 1

getting flesh-eating disease are 1 in 100,000.

1

Arrange the class in groups of four. Give each group

Page 66

• 1 small container with 9 baby lima beans and 1 baby lima bean

Step 2

colored red and

• 1 large container with 99 baby lima beans and 1 baby lima bean

colored red.

Display this statement: “The odds of coming down with flesh-eating

Page 66

disease this year are 1 in 100,000.”

Step 3

Explain that the red bean represents a person who *may* come down Page 66

with flesh-eating disease.

Step 4

2

• Have one student from each group pick a bean from the small container without looking.

• Ask, “Did anyone get a red bean?”

Display this: “1/10.” Explain that the odds of picking a red bean were

Page 66

1 in 10.

Step 5

Have another student from each group pick a bean from the large

Page 66

container. Ask, “Did anyone get a red bean?”

Step 6

Display this next to 1/10: “× 1 /100.” Explain that the odds of picking Page 66

a red bean were 1 in 100.

Step 7

Tell students to place the selected beans back into the large container 3

Page 67

and mix. Have another student once again pick a bean from the large

Steps 8 and 9

container. Ask, “Did anyone get a red bean?”

Display next to 1 /100, “× 1 /100.” Explain that, as before, the odds of Page 67

picking a red bean were 1 in 100.

Step 10

Explain that this activity modeled the 1 in 100,000 probability of

Page 67

coming down with flesh-eating disease.

Steps 11 and 12

- Display the answer to the probability calculation:

“ $1/10 \times 1/100 \times 1/100 = 1/100,000.$ ”

- Explain that to get flesh-eating disease, a group would have had

4

to pick the red bean from the small container and pick it again

both times from the large container.

Conclude the lesson by asking,

Page 67

- “What are two reasons why flesh-eating disease is so rare?”

Step 13

- “Which two general causes of disease interacted to allow flesh-eating disease to develop?”

= Involves copying a master.

= Involves using the Internet.

5

= Involves making a transparency.

Lesson 2

71

Lesson 2 Organizer: Print Version

Activity 1: *Causes of Disease*

Estimated time: 30 minutes

picking a red bean were 1 in 100.

Step 10

Explain that this activity modeled the 1 in 100,000 probability of

Page 67

coming down with flesh-eating disease.

Steps 11 and 12

• Display the answer to the probability calculation:

“ $1/10 \times 1/100 \times 1/100 = 1/100,000.$ ”

• Explain that to get flesh-eating disease, a group would have had to pick the red bean from the small container and pick it again both times from the large container.

Conclude the lesson by asking,

Page 67

• “What are two reasons why flesh-eating disease is so rare?”

Step 13

• “Which two general causes of disease interacted to allow flesh-eating disease to develop?”

= Involves copying a master.

= Involves making a transparency.

74

Rare Diseases and Scientific Inquiry

Lesson 3

The Difficulty of Diagnosis

1

2

Explain

At a Glance

Overview

3

Some people who have a rare disease struggle to obtain a proper diagnosis.

In Lesson 3, students become involved with a case study of a boy with the rare genetic disease Marfan syndrome. Because Marfan syndrome shares

symptoms with other, more-common diseases, it can take a long time for

patients to receive the correct diagnosis. Students observe how problems with a single gene can affect many different body systems. The lesson

concludes with students considering comments made by young people

with Marfan syndrome.

Major Concepts

- Because some rare diseases have symptoms similar to more-common**

4

diseases, obtaining a correct diagnosis can be difficult.

- A rare disease may have a genetic cause.**

- A rare disease, like some common diseases, may affect many different**

body systems at the same time.

- People with rare diseases may sometimes be viewed as being “different”**

by their peers and other members of society.

Objectives

After completing this lesson, students will have

- observed how problems in a single gene can affect many different body systems,**

5

75

- encountered the difficulty often associated with diagnosing a rare**

disease, and

• recognized that people affected by Marfan syndrome face challenges in their lives, and despite these challenges, they have the same hopes and dreams as others and perhaps a unique view about the value of health.

Teacher Background

Consult the following sections in *Information about Rare Diseases and*

Scientific Inquiry:

2.0 The Impact of Genomics on Rare Diseases (pages 24–26)

5.2 Marfan Syndrome (pages 29–31)

1 copy of Master 3.2 for each student

For Classes Using the Print-Based Version:

1 transparency of Master 3.1

1 copy of Master 3.2 for each student

1 copy of Masters 3.3, 3.4, 3.5, and 3.6 for each group of 4 students (each group member gets a different master)

Activity 2: Connective Tissue

1 transparency of Master 3.7

Activity 3: A Common Thread

For Classes Using the Web-Based Version:

1 copy of Master 3.8 for each pair of students

76

Rare Diseases and Scientific Inquiry

For Classes Using the Print-Based Version:

1 copy of Masters 3.8, 3.9, and 3.10 for each pair of students

1 transparency of Master 3.11

Equipment and Materials

For Activities 1 and 3, the Web-based versions, you'll need computers 1 with Internet access.

For Activity 2, you'll need, per student pair:

- 1 new (never-before-stretched) rubber band from a dish labeled "A"**
- 1 previously stretched rubber band from a dish labeled "B"**
- 1 paper clip**
- 1 soda can containing about 2 ounces of water***
- 1 meter stick**

***Any weight of 2–3 ounces (55–85 grams) that can be easily attached to the paper clip will work.**

2

Preparation

Activity 1

For classes using the Web version, verify that the computer lab is reserved for your class or that classroom computers are set up for the activities. Refer to Using the Web Site for details about hardware and software requirements for the Web site. Check that the Internet connection is working properly.

Log on to the Web Portion of Student Activities section of the Web site: 3

<http://science.education.nih.gov/supplements/rarediseases/student>

Select "Lesson 3: The Difficulty of Diagnosis."

Activity 2

Each pair of students will need a meter stick, a rubber band that has been repeatedly stretched (about 25 times), and a rubber band that hasn't been stretched. Use the same color rubber band

for both stretched and nonstretched 4

rubber bands so they look identical. Place the nonstretched rubber bands into a dish labeled “A” and the stretched rubber bands into a dish labeled “B.”

Activity 3

For classes using the Web version, verify that the computer lab is reserved for your class or that classroom computers are set up for the activities. Set the computers to the opening screen for Activity 3, as you did for Activity 1.

5

Lesson 3

77

Procedure

Note: This is an Explain lesson. It is designed to build on students’

common experience learning about the causes of rare diseases. Students

assume the roles of staff working for a medical geneticist. The scenario gives students a chance to apply their understandings about disease and scientific inquiry to explain the underlying cause of diverse symptoms

displayed by a patient. In this lesson, students will use what they learned in the first two lessons about diagnosing disease. At this point, students should be able to construct more strongly supported explanations. They

should focus on scientific principles as opposed to simply expressing their ideas and offering preliminary explanations.

We chose Marfan syndrome for this lesson because it is a rare disease

caused by mutations in a single gene. It affects different body systems and can be difficult to diagnose. Patrick, the fictional patient, is a teenager who wants to play sports but has medical problems that cause his parents to worry about his participation. This realistic scenario is designed to be engaging to middle school students.

The mutations associated Marfan syndrome affect connective tissue.

Realizing that students have little knowledge about connective tissue and its functions, we designed Activity 2 to give students a simple model that illustrates how the connective tissue of

people with Marfan syndrome

differs from that of healthy people.

Activity 1: A Parent's Dilemma

Estimated time: 25 minutes

1.

Begin the lesson by explaining that you will investigate a case study of a child who has a rare disease. In addition to the difficulty of obtaining a correct diagnosis, students will see how patients and their families cope with this particular rare disease.

2.

Display Master 3.1, *To Play or Not to Play?* Ask for different volunteers to read each paragraph aloud to the class.

3.

Ask students to place themselves in the position of Patrick's parents and then ask, "Would you allow Patrick to try out for the basketball team?"

Students' responses will vary. Many students will conclude that Patrick should be allowed to play basketball since none of the doctors said that he shouldn't play. Some students may know of a friend or family member with one of the conditions described and base their opinion on that example. At this time, don't express an

78

Rare Diseases and Scientific Inquiry

opinion yourself about whether Patrick should be allowed to play basketball.

Tip from the field test: Consider taking a poll of the students in the class. Ask how many would allow Patrick to play basketball. Later, at the end of the lesson, poll students again and discuss why their

**1
opinions have changed or stayed the same.**

**4.
Comment that this discussion about playing basketball and health prompted Patrick's parents to look into the family's medical history. Especially on his father's side of the family, some relatives have had medical problems similar to Patrick's.**

Several have had serious heart problems. The parents are worried that an inherited disease might run in the family.

**2
If necessary for your students, relate the idea of inherited disease to genes and mutations. You may need to explain that some diseases that run in families are caused by mutations to a single gene and that by looking at a family tree, doctors can sometimes see**

evidence for a genetic cause for the disease. This connection will be important later in the lesson.

5.

Explain that Patrick and his parents next visited a medical geneticist, a doctor who specializes in diagnosing people with genetic diseases. A medical geneticist works with other doctors

3

when it appears that a patient's disease may have a genetic cause.

Content Standard C:

Every organism

Again, if necessary, you may want to explain that many (though not all) genetic diseases are rare. This means that a family doctor may requires a set of

never have seen a patient with the rare disease and not think of it

instructions for

when making a diagnosis.

specifying its traits.

Heredity is the

6.

Explain that for the rest of Activity 1, students will work in

passage of these

groups of four. They will assume the roles of medical specialists

instructions from one

assisting the medical geneticist in diagnosing Patrick. Because

4

generation to another.

Patrick has medical problems that affect different body systems,

each member of the group will be responsible for a different

body system. The four specialties (and their body systems)

are

- orthopedist (skeletal system),
- ophthalmologist (visual system),
- cardiologist (heart and circulation system), and
- pulmonologist (respiratory system).

5

Lesson 3

79

Note: During Lesson 5, students will create an informational poster about either Marfan syndrome or childhood leukemia. With this in

mind, you might want to stress the need to take good notes during

Lessons 3 and 4.

Content Standard C:

The human organism

has systems for

(For print version, skip to Step 7-p on page 81.)

digestion, respiration,

movement, control,

***Report Form.* Direct students to their computer stations.**

and coordination,

and for protection

Web browsers should be at

from disease. These

<http://science.education.nih.gov/supplements/rarediseases/student>

systems interact with

each other.

This is a menu page that contains a link for this activity.

8-w. Instruct students to click on “Lesson 3: The Difficulty of

Diagnosis,” and then “Activity 1: A Parent’s Dilemma.” Then they

should click on one of the medical specialties (“Activity 1:

Orthopedist,” “Activity 1: Ophthalmologist,” “Activity 1:

Cardiologist,” or “Activity 1: Pulmonologist”).

Each group member must obtain information about Patrick that corresponds to the medical specialty the group is assigned. Each medical specialty contains a report from Patrick’s doctor. To help them make sense of this report, each medical specialty includes a link to a Medical Reference Manual: Disorders of Connective Tissue, which provides helpful background information. If you have enough computers for each student, then the process will move quickly.

9-w. Explain that information about Patrick’s medical history and physical exam is provided for each medical specialty. Instruct students to

- review their assigned medical specialty;**
- record on Master 3.2 what they learn about Patrick’s medical history;**
- record on Master 3.2 what they learn from Patrick’s physical exam; and**
- use the Medical Reference Manual to learn about possible causes of Patrick’s medical problem, and then record them on Master 3.2.**

Continue with Step 10 on page 81.

80

Rare Diseases and Scientific Inquiry

In classrooms using the print version of the activity:

7-p. Give each student one copy of Master 3.2, *Medical*

Specialty Report Form.

8-p. Give each group one complete set (four masters total) of these masters about Patrick's physical and medical history:

1

- **Master 3.3, *Heart and Circulatory System***
- **Master 3.4, *Visual System***
- **Master 3.5, *Respiratory System***
- **Master 3.6, *Skeletal System***

Each group member receives a set of handouts corresponding to that person's assigned medical specialty. The information in the Medical Reference Manual section of each handout should help students make some sense of this information.

9-p. Instruct students to

Content Standard A:

2

- **read the information on the handouts,**

Students should base

- **record on Master 3.2, the patient form, what they learn about their explanations on**

Patrick's medical history,

what they observed,

• record on Master 3.2 what they learn from Patrick's physical

and as they develop

exam, and

cognitive skills,

• use the Medical Reference Manual section from each handout

problems are connected and what evidence they have to

relationships based

support their conclusions.

on evidence and

logical argument.

Students should be able to use specific information from the doctors' reports and from the Medical Reference Manual to support their conclusions.

11. Ask for volunteers from each group to share their conclusions

4

about whether Patrick's various medical problems are connected.

Students should see a pattern: Patrick has problems with four different body systems. For each body system, the Medical Reference Manual mentions that the problem may be associated with connective tissue or, more specifically, with Marfan syndrome or Ehler-Danlos syndrome.

12. Congratulate the groups on their good work and agree that there might be a common cause for Patrick's medical problems that involves connective tissue.

5

Lesson 3

81

Activity 2: *Connective Tissue*

Estimated time: 25 minutes

1.

Ask, "What is connective tissue?"

Content Standard A:

Different kinds

Students will probably not be able to answer this question. Since the name is descriptive, some students may venture guesses that

of questions

connective tissue somehow holds parts of the body together.

suggest different

Accept all answers and explain that you will investigate the role of

kinds of scientific

connective tissue in this and the next activity.

investigations.

Some investigations

2.

Explain that connective tissue is largely made of proteins.

Further explain that it forms tissues that help hold organs in

involve observing

place, and it connect muscles to bones and bones to bones.

and describing

objects, organisms, or

Note: You may point out to students that our skin is largely made of events; some involve

connective tissue and that this allows the skin to be elastic—capable of collecting specimens;

stretching. Also mention that as we age, the elasticity of skin decreases.

some involve

You can simply demonstrate this by asking students to pinch some of the skin on the back of their hands and notice how long it takes the skin to experiments; some

return to its normal position. Then, repeat the demonstration using your involve seeking more

own hand. Because you are older, the skin on your hand will take longer information; some to return to its normal position.

involve discovery
of new objects and

3.

Explain that for this demonstration, rubber bands will represent connective tissue. Each student pair will compare the elasticity phenomena; and (or looseness) of two rubber bands.

some involve making
models.

4.

Display Master 3.7, *Measuring Elasticity*. Read the instructions aloud and make sure that students understand how to perform the elasticity measurements.

5.

Arrange the students in pairs. Give each pair

- 1 meter stick
- 1 rubber band from dish A (nonstretched)
- 1 paper clip
- 1 soda can containing about 2 ounces of water (or other 2–3-ounce weight)

6.

Instruct pairs to record in their notebooks

- the question they are investigating and
- how far down the meter stick the rubber band stretched.

Pairs should write in their notebooks a question such as, “Is one rubber band more elastic than the other?” Give students about five minutes to complete the measurements.

7.

Collect the rubber bands from each pair and set them aside.

Next, give each pair one rubber band from dish B (previously

82

Rare Diseases and Scientific Inquiry

stretched). Instruct students to make and record measurements as before.

8.

After students have made and recorded their measurements, ask for volunteers to state their conclusions. Specifically, ask if the two rubber bands performed the same or differently—and if differently, how so.

1

Students should report that rubber band B (the previously stretched one) stretched further than rubber band A (the nonstretched one).

9.

Explain that the rubber band from dish A (the nonstretched one) represents normal connective tissue. Ask, “What do think the rubber band from dish B represents?”

Students may have trouble answering this question. If so, guide the discussion to Patrick and the possible association of his symptoms

2

to connective tissue. Before moving on, make sure students understand that rubber band B represents the connective tissue in a person whose cells contain DNA that has a mutation that causes the connective tissue to be looser than it should be.

10. Ask, “How might looser connective tissue affect the body? Think about Patrick and his medical problems.”

Mentioning Patrick may cause students to bring up mitral valve prolapse or a dislocated eye lens. If not described by a student, ask guiding questions to bring out the role of connective tissue. For

3

example, the looser connective tissue causes the heart valve flaps to change shape and not make a tight seal, or the looser connective tissue can’t hold the eye lens tightly in place.

11. Explain that in the final activity of the lesson, students will return to Patrick and his family and investigate whether he may have a rare disease affecting his connective tissue.

Activity 3: A Common Thread

4

Estimated time: 25 minutes

1.

Remind students that in the previous analysis they found that Patrick’s medical symptoms involve more than one body system and that these symptoms seem to be related to connective tissue. Explain that they will now investigate some disorders that affect connective tissue and try to decide whether one rare disorder is more likely than the others to be responsible for

Patrick's medical condition.

5

Lesson 3

83

In classrooms using the Web version of the activity:

2-w. Arrange the class into pairs. Give each pair one copy of Master 3.8, *Diagnosing a Connective*

Tissue Disorder.

3-w. Direct the student pairs back to their computers. Instruct them to click on “Lesson 3: The Difficulty of Diagnosis,” then “Activity 3: A Common Thread,” and then “Activity 3: Medical Reference Manual.”

Students should follow the instructions on Master 3.8 to compare Patrick's medical symptoms to those expected for four different disorders of connective tissue. Give students about 10 minutes to complete the tasks.

In classrooms using the print version of the activity:

2-p. Arrange the class into pairs. Give each pair one copy

of Master 3.8, *Diagnosing a Connective Tissue Disorder*, and one copy of Master 3.9, *Medical Reference Manual*:

Disorders of the Connective Tissue.

3-p. Instruct student pairs to follow the instructions on Master 3.8

to compare Patrick's medical symptoms with those expected

for four different disorders of connective tissue. Allow about 10

minutes for students to complete the tasks.

4.

After students have finished, ask for volunteers to report their

conclusions.

Students should report that, although some of Patrick's symptoms fit

more than one disorder, virtually all of his symptoms are consistent

with Marfan syndrome.

Patrick's

Long arms and legs

Yes

Curvature of spine

Yes

Yes

84

Rare Diseases and Scientific Inquiry

5.

Agree that Marfan syndrome is the best explanation for Patrick's symptoms. Ask,

- “What is the cause of Marfan syndrome?”**
- “What evidence is there to suggest that Patrick may have**

Marfan syndrome?”

Students should recall that Marfan syndrome runs in families and

1

results from mutations in a gene that codes for a connective tissue protein.

Students should report that Patrick has many of the Marfan symptoms listed in the Medical Reference Manual.

In classrooms using the Web version of the activity:

6-w. Explain that to complete Patrick’s diagnosis, you want to see whether there is evidence of Marfan

2

syndrome in Patrick’s family. Direct the student pairs back to their computers and instruct them to click on “Lesson 3: The Difficulty of Diagnosis,” then “Activity 3: A Common Thread,” and then “Patrick’s Family Tree.” Students should look at the information about Patrick’s family and record in their notebooks any evidence they find that suggests a history of Marfan syndrome in the family.

Students can roll over or tab through photos of each family member and read a brief description of the person’s medical

3

history. They will see a diagram of a family tree that shows only the father’s side of the family. If students ask about the mother’s side, explain that it is free of medical symptoms associated with connective tissue disorders and, therefore,

not of interest.

Students also may notice that that Patrick has six uncles but no aunts. They may conclude that Marfan syndrome is sex-linked.

This is a real family tree, and it's just by chance that the family tree has so many males.

4

In classrooms using the print version of the activity:

6-p. Explain that to complete Patrick's diagnosis, you

want to see if there is evidence of Marfan syndrome

in Patrick's family. Give each student pair one copy of

Master 3.10, *Patrick's Family Tree*. Instruct students to look at the information about Patrick's family and record in their

notebooks any evidence they find that suggests a history of

Marfan syndrome in the family.

5

Lesson 3

85

They will see a diagram of a family tree that shows only the father's side of the family. If students ask about the mother's side, explain that it is free of medical symptoms associated with connective tissue disorders and therefore not of interest.

Students also may notice that Patrick has six uncles but no aunts.

They may conclude that Marfan syndrome is sex-linked. This is a real family tree, and it is just by chance that the family tree has so many males.

7.

After students have finished, remind them of the three major causes of disease: infectious agents, heredity (genetics), and exposure to environmental toxins. Ask,

- “Did you find any evidence of Marfan syndrome in Patrick's family?”**
- “Is there evidence to suggest that Patrick's symptoms may have a different cause?”**

The process of

Give students 5–10 minutes to complete the task. Students should report that Patrick's father, two uncles, and grandfather have had

diagnosing Patrick

heart problems. Heart problems have many causes other than with Marfan

Marfan syndrome; however, students should also note that other syndrome requires

Marfan-related symptoms are mentioned such as scoliosis, a students to apply detached eye lens, and a collapsed lung.

understandings about scientific inquiry. You

Some students may believe that Patrick's symptoms come from can assess these

another cause. As in Lesson 2, they may mention that people living in close quarters can pass on infections or may be exposed understandings by

to the same environmental toxins. Acknowledge the truth of these noting how well

observations, but point out that the members of Patrick's extended students sift through

family did not live together.

various forms of evidence to find

symptoms of Marfan syndrome and ask how these symptoms would

evaluate alternative

affect their daily lives.

explanations for

Patrick's symptoms.

In classrooms using the Web version of the activity:

9-w. Conclude the lesson by explaining that students

will now watch a brief video of young people who

have Marfan syndrome discussing their experiences. Instruct

students to first write in their notebooks some questions they

would like to ask a person with Marfan syndrome about what

it is like to live with the condition.

86

Rare Diseases and Scientific Inquiry

10-w. Direct students to their computers and instruct them to click

on "Lesson 3: The Difficulty of Diagnosis," then "Activity 3: A

Common Thread," and then "Activity 3: Patient Video."

The video is brief, just 3.5 minutes long. If you have the ability to

project the computer image, it may be simpler to watch the video

1

as a class.

11-w. After students have watched the video, reconvene the class.

Ask for volunteers to describe their reactions to the video and how it addressed (or did not address) the questions they wrote in their notebooks.

The video will not answer all of the questions asked by the students. Suggest that they perform a Web search to access information from foundations and patient support groups that can answer their questions.

2

Note: Students could also explore the Marfan syndrome section of the Positive Exposure site (www.positiveexposure.org/marfan.html). Fashion

photographer, Rick Guidotti and Diane McLean, MD, PhD, MPH wanted

to share the beauty of rare disease patients, so, in 1997, they founded Positive Exposure, starting with photos of some people with albinism.

The site now features people with almost 30 diseases.

Tip from the field test: If you took a poll of the students in the class at the beginning of the lesson,

3

take another now. Discuss why their opinions have changed or stayed the same.

End of Web-based activity.

In classrooms using the print version of the activity:

9-p. Conclude the lesson by explaining that students will

now consider how Marfan syndrome affects the lives

of those who have it. Ask students to take a moment to reflect

4

on what they have learned about Marfan syndrome. Instruct

them to write down in their notebooks

- **one question they would ask a doctor about having Marfan syndrome and**

- **one way they think having Marfan syndrome might affect their lives.**

10-p. After students have completed the tasks, ask for volunteers to report what they wrote in their notebooks.

5

Consider displaying a couple of questions and comments that students wrote in their notebooks.

Lesson 3

87

Tip from the field test: If you took a poll of the students in the class at the beginning of the lesson, take another now. Discuss why their opinions have changed or stayed the same.

11-p. Display Master 3.11, *Living with Marfan Syndrome*. Explain that this master includes some comments from teenagers who have

Marfan syndrome. Give students a couple of minutes to read the master.

Reveal the questions and comments on Master 3.11 one at a time, as you talk about them.

12-p. Instruct students to reflect on the questions and comments from the young people who have Marfan syndrome. Ask,

- **“Were their questions and comments similar to or different from yours?”**

- **“How would you want to be treated by your classmates if you**

had Marfan syndrome?”

Answer key for questions on Master 3.11, *Living with Marfan*

Syndrome

1. “Is there any possible way for the Marfan gene to be detected before a child is born and maybe find a way to prevent it from mutating itself?”

At present, prenatal testing is not available for Marfan syndrome.

The mutated gene associated with Marfan syndrome is found in every cell of the body. Today’s technology cannot replace the mutated gene with a nonmutated gene.

2. “When they measured my heart with the echocardiogram, they told my mom they don’t think I should do marching band. I was wondering, if I don’t exert myself too much, if I take it at my own pace, do you think I will still be able to do it?”

The student asking the question was advised that she might be able to continue with marching band if after a practice or a performance, she didn’t feel exhausted and wasn’t short of breath and sweating.

tissue and will compare the elasticity of two rubber bands.

Step 3

Display Master 3.7, read the instructions aloud, and make sure

Page 82

students understand how make the measurements.

Step 4

Arrange students in pairs. Give each pair

Page 82

- 1 meter stick

Step 5

- 1 rubber band from dish A (nonstretched)
- 1 paper clip

2

- 1 soda can containing about 2 ounces of water (or other 2–3-ounce weight)

Instruct pairs to record in their notebooks

Page 82

- the question they are investigating and

Step 6

- how far down the meter stick the rubber band stretched.

Collect the rubber bands. Give each pair a rubber band from dish B

Page 82

(previously stretched), and instruct pairs to make and record

Step 7

measurements as before.

Ask volunteers to report their conclusions. Did the two rubber bands

Page 83

perform differently and if so, how?

Step 8

3

Explain that the rubber band from dish A (nonstretched) represents

Page 83

normal connective tissue. Ask,

Steps 9 and 10

- **“What do you think the rubber band from dish B represents?”**
- **“How might looser connective tissue affect the body?”**

Explain that now they will investigate whether Patrick has a rare

Page 83

disease affecting his connective tissue.

Step 11

4

5

Lesson 3

93

Activity 3: *A Common Thread*

Estimated time: 50 minutes

Page and Step

Remind students that Patrick’s symptoms involve more than one body

Page 83

system and seem to have connective tissue in common. They will

Step 1

decide which, if any, rare disorder of connective tissue Patrick may have.

Arrange the class in pairs. Give each pair a copy of Master 3.8 and Page 84

Master 3.9. Instruct students to use information on Master 3.9 to Steps 2-p complete Master 3.8.

and 3-p

Ask volunteers to report their conclusions.

Page 84

Step 4

Agree that Marfan syndrome best explains for Patrick’s symptoms. Ask,

Page 85

- **“What is the cause of Marfan syndrome?”**

Step 5

- **“What evidence is there to suggest that Patrick may have Marfan syndrome?”**

Explain that students will look on a handout for evidence of Marfan

Page 85

syndrome in Patrick’s family and record in their notebooks what they

Step 6-p

find. Give each student pair a copy of Master 3.10.

Remind students of the three major causes of disease. Ask,

Page 86

- **“Did you find any evidence of Marfan syndrome in Patrick’s family?”**

Step 7

- **“Is there evidence to suggest that Patrick’s symptoms may have a different cause?”**

Explain that an early diagnosis of Marfan syndrome allows people to

Page 86

take steps to protect their health. Ask, “In what ways might having

Step 8

Marfan syndrome affect your life?”

Conclude by explaining that students will now consider how Marfan

syndrome affects the lives of people who have it. Ask students to write Step 9-p in their notebooks

- one question they would like to ask a doctor about Marfan

syndrome and

- one way they think having Marfan syndrome might affect their lives.

Ask volunteers to report what they wrote.

Step 10-p

Display Master 3.11, and give students time to read it. Ask,

- “Were the questions and comments from the young people on

Steps11-p

the master similar to yours?”

and 12-p

- “How would you want to be treated by your classmates if you

had Marfan syndrome?’

= Involves making a transparency.

= Involves copying a master.

Lesson 4

The Importance of Medical Research

1

2

Elaborate

At a Glance

Overview

Lesson 4 introduces the idea that medical research is important for the 3

treatment of a rare disease, childhood leukemia. In the first activity, students meet Jason and Kim, parents of a daughter named Hanna,

who has been diagnosed with childhood leukemia. Students perform a

simulated Web search to learn about the disease. They must sift through different Web hits to find relevant and accurate information about the

disease. In considering a genetic cause of the disease, students perform a karyotype analysis on each family member. In the second activity, students are introduced to treatments for leukemia. They design a clinical trial to guide the treatment of the disease. Finally, students watch a brief video (or, for classes using the print version, act out an interview) of a leukemia 4

survivor discussing what it's like to live with the disease.

Major Concepts

- Much medical information can be found on the Internet; however, this information must be examined carefully to assess its relevance and accuracy.**
- Lack of appearance in a family history does not mean that a disease doesn't have a genetic cause.**
- Leukemia is a cancer of the white blood cells.**
- Clinical trials have greatly improved the survival rates of children with leukemia.**

5

95

Objectives

After completing this lesson, students will

- have used a simulated Web search to learn about the cause, symptoms, and diagnosis of childhood leukemia;**
- have performed a karyotype analysis to diagnose leukemia;**
- have designed and tested a clinical trial for treating childhood leukemia; and**
- have considered the challenges associated with living with leukemia.**

2 copies of Master 4.17 for the class

Equipment and Materials

For Activities 1 and 2, Web-based versions, students will need computers with Internet access.

2

Preparation

Activities 1 and 2

For classes using the Web version, verify that the computer lab is reserved for your class or that classroom computers are set up for the activities.

Refer to Using the Web Site for details. Check that the Internet connection is working properly.

3

Log on to the Web Portion of Student Activities section at <http://science.education.nih.gov/supplements/rarediseases/student>

Select “Lesson 4: The Importance of Medical Research.”

Procedure

Note: This is an Elaborate lesson. It gives students an opportunity to take 4

what they have learned about rare diseases and scientific inquiry from

the previous lessons and apply it in a new setting. In the first activity, students place themselves in the role of a parent whose child has just

been diagnosed with childhood leukemia. They perform a simulated Web

search to learn about the disease. This activity is designed to help students hone their skills in evaluating information for relevance and accuracy.

The genetic link to the disease is made real to students by having them perform a simple karyotype analysis.

In the second activity, students exercise their understandings of scientific 5

inquiry in the context of clinical trials. Designing a fair test is a common Lesson 4

97

inquiry skill. We selected childhood leukemia because it is a rare disease that has a genetic cause. It's a serious disease, but, at the same time, it represents a real success story in the application of medical research to treatment.

The activity includes a graph that shows how survival rates for children with leukemia have dramatically improved over the past few decades. The lesson concludes with a video (or a role-play) of a young woman who has come through treatment for the disease and is now pursuing a medical

education. The inclusion of this story is designed to give students an opportunity to empathize with someone who has had leukemia and also to leave them with the vision of a positive outcome.

Activity 1: An Unwelcome Diagnosis

Estimated time: 100 minutes

1.

Begin the lesson by explaining that students will investigate a case study involving a child with a rare disease.

This case study introduces the use of clinical trials to obtain evidence about which treatment options are most effective. It's not important that students understand the clinical trials process.

Instead, clinical trials provide a real-life example of how the practice of science (especially proper experimental design) can help improve people's health.

2.

Display Master 4.1, *Doctor Visits*. Ask for volunteers to read aloud each section of text.

3.

Ask students how they would feel if they were Hanna's parent and received this disturbing news. Ask, "What would you

Content Standard C:

do now that you have learned that your daughter has been diagnosed with leukemia?"

Disease is a

breakdown in

Students' responses will vary. Some students may suggest getting a structures or functions

second opinion. Others may suggest researching cancer treatment of an organism. Some

centers. Accept all answers and guide the discussion to the need to diseases are the result

obtain more information.

of intrinsic failures of

the system. Others are

visit, Jason and Kim were so upset that they didn't take notes

by infection by other

or remember much of what they were told. After returning

organisms.

home with Hanna, they performed an Internet search on

leukemia.

98

Rare Diseases and Scientific Inquiry

5.

Ask students,

- “If you were Hanna’s parent, what information would you

want to have about the disease?”

- “Where could you find the information that you want?”

Make a list on the board of the types of information about leukemia

the students request. Students may mention a variety of sources

1

for this information, including their doctors, books, television

programs, the Internet, and, possibly, friends and family who have

had to cope with the disease.

6.

Give each student one copy each of Master 4.2, *Internet Search*

Results, and Master 4.3, *Evaluating Internet Search Results*.

Instruct students to view the list of hits on Master 4.2 and

follow the instructions on Master 4.3 to rank the hits from most

helpful to least helpful.

2

This step is designed to challenge students to sort through

information related to leukemia and decide

- which hits are most likely to contain the information they want

and

• which hits are likely to contain information that is accurate and unbiased.

There is no single correct answer to ranking these eight hits. Rather, you should see whether students can sift through the lists to identify one or two of the best hits. Likewise, students should be able to identify another couple of hits as clearly not helpful to providing the 3 information they want.

In this activity, students are ranking hits based on relevance and accuracy. There are, however, other criteria that students should use to assess the usefulness of Web sites. For example, the site should present information that is up to date, and the information should be as free of bias as possible, such as the bias associated with promoting a product or service.

Answer key for Web hits on Master 4.2, *Internet Search Results*

4

1. Federal Center for Cancer Research

Information about leukemia, its causes, symptoms, diagnosis, and treatment ...

Hit 1 is from a fictional U.S. government research organization, the Federal Center for Cancer Research. The Federal government, however, does support medical research, primarily through the

5

Lesson 4

99

National Institutes of Health (NIH). For example, the Office of

Rare Diseases Research (<http://rarediseases.info.nih.gov/>) and the National Cancer Institute (<http://www.cancer.gov/>) are parts of NIH and provide accurate medical information resources for the general public. Such government sites post information that has been reviewed by experts and is labeled “no commercial bias,” which means that the information presented hasn’t been selected to promote the use of any particular product or service. Such sites are a logical place to begin to learn about a rare disease.

2. My Leukemia Blog

Living with Cancer: Reflections and remembrances of a cancer survivor ...

Personal blogs can provide a window into the life of someone who has a rare disease. The person may or may not choose to include medical information as part of the blog. Furthermore, any medical information on the blog may reflect a possibly incomplete understanding by the author. Although such blogs can be helpful resources, they are not the best place to begin to learn about a rare disease.

3. The Cancer Research Center at Lincoln State University

Breast cancer, Prostate cancer, Leukemia, Lymphoma, ...

Research centers based at universities often provide medical information to the public. The information is reviewed by experts for accuracy. Often, the posted information is tied to the research interests of individual scientists and may be too specific to be a starting point for searching about a rare disease.

4. Information about Leukemia from the American Blood

Cancer Society

**Cells of the blood, Stem cells and leukemia, White blood cells
and bacteria ...**

Hit 4 is from a patient support group. Although the American Blood Cancer Foundation is fictional, a large number of patient-support organizations exist to promote medical research and support for people with rare diseases. In the case of leukemia, the Leukemia and Lymphoma Society (http://www.leukemia.org/hm_lls) is a very useful resource that provides reliable disease information as well as a variety of patient services. Such sites are a logical place to begin to learn about a rare disease.

100

Rare Diseases and Scientific Inquiry

5. Leukemia—Medhealthopedia: The Do-It-Yourself Encyclopedia

Leukemia is a form of cancer that is ...

Medhealthopedia is a fictional Web site that provides medical information to the public in a manner similar to Wikipedia. On such a site, the information posted is written collaboratively by users of the site. The information is often reliable, but there is

1

no assurance that experts have reviewed it or that it is free of commercial bias.

6. Cancer drugs for less! Leukemia

Order drugs from overseas to treat leukemia and save!

Hit 6 is included as a reminder that some information about disease on the Internet is more concerned with making money for someone than with providing objective medical information.

2

7. Fed approves new drug to treat leukemia

Medical Business Weekly (Washington, DC)—The Food and Drug Administration today approved Hamilton Pharmaceutical's As students report drug Arresta for the treatment of leukemia ... how they ranked the hits from the

Hit 7 is from a business publication. Although the information is likely to be accurate, it only describes one specific development in simulated Web the field of leukemia research and is not a good place to begin to search, you have learn about the disease.

an opportunity to assess how well they

8. Leukemia: Definition from Medical Jargon.com

3

use their critical-

Leukemia—A form of cancer involving the white blood cells.

thinking skills to

White ...

evaluate information

Hit 8 comes from a medical dictionary and only provides a brief

for its relevance and

definition of the disease.

accuracy.

7.

Display Master 4.3. Ask for volunteers to report how they

ranked the Web hits.

Students' responses will vary. Allow several volunteers to report

their rankings with explanations of their reasoning. Remember

4

that the precise ranking of the Web sites is not important. Ideally,

students will recognize that Hits 1 and 4 are the best places to begin

to learn about leukemia. Hits 2, 3, and 5 can also be useful, but the

information may not be as relevant or as accurate as that from Hits

1 and 4. Some students may reason that Hit 8, which provides a

definition, is a good place to start. Hits 1 and 4, however, will also

provide a definition along with a lot of other useful information.

Hits 6 and 7 are clearly not very useful.

5

Lesson 4

101

In classrooms using the Web version of the activity:

8-w. Arrange the students in pairs. Give each pair

one copy of Master 4.4, *Summarizing Information*

***about Leukemia*. Explain that student pairs will go to their computers and access information about leukemia from Hits**

1 and 4 from the Internet search. Pairs should summarize on

Master 4.4 the information from both Web hits.

Computers should be at this URL:

<http://science.education.nih.gov/supplements/rarediseases/student>

This is a menu page that contains a link for this activity.

9-w. Direct the pairs to their computer stations and instruct them

to click on “Lesson 4: The Importance of Medical Research,”

then “Activity 1: An Unwelcome Diagnosis,” and then

“Activity 1: Simulated Web Search.”

“Activity 1: Simulated Web Search” contains information found

on Hits 1 and 4, which were listed on Master 4.2. These are the

hits judged to be the best places to begin a search for information

about leukemia.

In classrooms using the print version of the activity:

8-p. Arrange the students into pairs. Give each pair one

copy each of Master 4.4, *Summarizing Information*

about *Leukemia*, and Master 4.10, *Information about Leukemia*.

9-p. Explain that student pairs should look at the information on

Master 4.10 and summarize it on Master 4.4.

Master 4.10 contains information found on Hits 1 and 4, which were listed on Master 4.2. These are the hits judged to be the best places to begin a search for information about leukemia.

10. After students have completed the tasks, reconvene the class.

Ask whether students have any questions about the information they found from the Internet search.

Clarify any confusion and misunderstandings. If students ask about the case of leukemia, ask them to hold on because the class is about to consider that question.

102

Rare Diseases and Scientific Inquiry

11. Ask students to recall the three causes of disease.

If necessary, ask guiding questions to bring out the three causes: infectious agents, heredity (genetics), and exposure to environmental toxins.

12. Ask, “What types of information would you want to have to

1

decide which of the three causes of disease applies to leukemia?”

Students may suggest information about a family history of leukemia and about exposure to toxic substances or pathogens.

13. Explain that the parents, Jason and Kim, have two children:

Hanna, who was just diagnosed with leukemia, and her older

brother, Rick, who is healthy. There is no history of leukemia in the family. Ask, “Does this rule out genetics as the cause of leukemia?”

2

Most students will conclude that it does. At this time, accept all answers.

14. Ask, “What about environmental exposure or infections?”

Some students may remark that Hanna shows signs of infection.

Point out that the rest of the family is infection free. Also, if Hanna had been exposed to a dangerous substance in her environment, we

might also expect that the rest of the family had also been exposed, but they remain healthy.

3

15. Acknowledge that so far, there isn’t good evidence to suggest a cause for Hanna’s leukemia. Return to the idea of genetics.

Ask students to recall Information about Leukemia from the American Blood Cancer Society. Ask, “What happened to a stem cell that led to leukemia?”

Students should recall that a single stem cell acquired mutations and began to grow out of control, producing large numbers of unhealthy white blood cells.

Note: Since your students have a limited understanding of genetics, they 4

may believe that mutations are something that only took place many years ago. You may need to stress the idea that mutations are happening now

and can cause disease. Explain that cells have mechanisms that detect and correct mutations, but in rare cases, these mechanisms fail.

16. Explain that although people sometimes inherit mutations

from their parents, new mutations happen as well. Mutations in DNA can occur from exposure to sunlight or to substances in the environment, or sometimes they occur just because the cell makes a DNA-copying mistake during cell division that is

5

Lesson 4

103

not corrected. If mutations occur in genes associated with cell growth, cancer can result.

This is an opportunity to have students think back to Lesson 3, which dealt with Marfan syndrome and a genetic mutation. Both

Content Standard C:

diseases have a genetic association. If you think it would be helpful

Hereditary information

ask, “How are they similar? How are they different?”

is contained in

genes, located in

17. Explain that in some genetic disorders, the effects of mutations the chromosomes can be so large that they change the number and appearance of the chromosomes. Scientists call a photograph of chromosomes of each cell. Each

in packages called chromosomes. Each different chromosome

contains a single molecule of DNA.

or by many genes,

and a single gene can

18. Explain that students first need to see what a normal karyotype influence more than

looks like before they can understand what a karyotype with

one trait. A human

a large mutation looks like. Instruct students to read the

cell contains many

information on Master 4.5 and answer the question at the bottom.

thousands of different

While students are reading the handout, circulate and answer any

genes.

questions they may have. For example, you may need to explain

that the karyotype is made by squashing cells and taking a picture

of the chromosomes through a microscope. Then, the photograph

is cut up, and the chromosomes are rearranged in pairs to make it easier to see abnormal patterns.

Students may observe differences in the shapes of chromosome pairs in the karyotypes, but these shapes result from how the chromosomes were positioned when the cells were squashed and do not represent genetic mutations. A normal karyotype has 22 pairs of numbered chromosomes as well as a pair of sex chromosomes (X and Y). A male has one X chromosome and one Y chromosome. A female has two X chromosomes and no Y chromosome. The individual whose karyotype is depicted here is male because both an X and a Y chromosome are present.

19. Explain that in the case of leukemia, the karyotype would be expected to show three, instead of the normal two, copies of one or more of the numbered (nonsex) chromosomes.

Students should pay attention to the numbers of each chromosome. The presence of three copies of a chromosome is abnormal and helps diagnose leukemia.

104

Rare Diseases and Scientific Inquiry

(For print version, skip to Step 20-p on page 106.)

In classrooms using the Web version of the activity:

20-w. Direct student pairs back to their computers.

Explain that they will first observe karyotypes prepared from blood samples taken from each of Hanna's family members.

1

Instruct students to predict whether the karyotype for each family member will appear normal or abnormal.

Students should make predictions for Jason and Kim (Hanna's parents), Hanna, and Rick (Hanna's brother). They should recall that Hanna is the only family member with leukemia and, therefore, only her karyotype should appear abnormal.

Note: To reinforce the role of the sex chromosomes, you may want to ask students to identify the sex of each family member from the person's 2 karyotype.

21-w. Instruct student pairs to click on "Lesson 4: The Importance of Medical Research," then "Activity 1: An Unwelcome Diagnosis," and then "Activity 1: Karyotypes." Students will see a karyotype from the parents, Jason and Kim, as well as from Hanna and her brother, Rick. Students should record in their notebooks whether each karyotype is normal or

abnormal and whether the evidence supports their predictions.

22-w. Explain that the link labeled “View All of Hanna’s Karyotypes”

3

will display three karyotypes from Hanna. The first karyotype was taken from her blood sample as before, the second was from her cheek cells, and the third, from her hair follicles. As before, instruct student to predict whether each karyotype will be normal or abnormal.

Students should predict that the karyotype from Hanna’s blood sample will appear abnormal, as it was earlier. Some students may

Evaluating karyotypes

not realize that the abnormal chromosomes are limited to the taken from different

white blood cells. They will see, however, that the karyotypes from body tissues allows

4

Hanna’s cheek cells and hair follicles are normal.

you to assess how

karyotypes taken from these three different tissues?”

understand the

basic idea of cancer,

Guide the discussion to bring out that the leukemia started with

namely, that the

a single stem cell in the bone marrow that went on to produce disease begins with a large population of unhealthy white blood cells, each with an mutations in a single abnormal karyotype. In contrast, the cheek cells and hair follicle cells are unaffected by leukemia and show normal karyotypes. cell in one part of the body.

**5
End of Web-based activity.**

Lesson 4

105

In classrooms using the print version of the activity:

20-p. Explain that students will look at karyotypes prepared from blood samples taken from each of Hanna's family members. Ask students to predict whether the karyotype for each family member will appear normal or abnormal and to record in their notebooks whether the evidence supports their predictions.

Students should make predictions for Jason and Kim (Hanna's parents), Hanna, and Rick (Hanna's brother). They should recall that Hanna is the only family member with leukemia and, therefore, only her karyotype should appear abnormal.

Note: To reinforce the role of the sex chromosomes, you may want to ask students to identify the sex of each family from the person's karyotype.

21-p. Give each student pair one copy of Master 4.11, *Family*

***Karyotypes.* Instruct students to examine the karyotypes and note whether their predictions were confirmed.**

If any pairs struggle with this task, remind them that each numbered chromosome should exist as a pair. If a third copy of any chromosome is present, it represents a mutation and helps diagnose leukemia.

22a-p. Explain that students will now look at three different karyotypes, all from Hanna. One karyotype is taken from her blood as before, one is from her cheek cells, and another, from her hair follicles. As before, instruct students to predict whether each karyotype will be normal or abnormal and to record their predictions in their notebooks.

Students should predict that the karyotype from Hanna’s blood sample will appear abnormal, as it was earlier. They likely will predict that the karyotypes from her cheek cells and hair follicles will also be abnormal.

22b-p. Give each student pair one copy of Master 4.12, *Hanna’s*

***Karyotypes.* Instruct students to examine the karyotypes and note whether their predictions were confirmed.**

Some students may not realize that the abnormal chromosomes are limited to the white blood cells.

23-p. Ask, “How can you account for the appearance of the karyotypes taken from these three different tissues?”

Guide the discussion to bring out that the leukemia started with a single stem cell in the bone marrow that went on to produce a large population of unhealthy white blood cells, each with an abnormal karyotype. In contrast, the cheek cells and hair follicle cells are unaffected by leukemia and show normal karyotypes.

Evaluating karyotypes

disease begins with

known to have some benefit, then it is unethical to replace that

mutations in a single

treatment with another one whose value is unknown.

cell in one part of the

2

body.

2.

Explain that doctors often compare the effectiveness of cancer treatments by looking at the percentage of patients who are still alive five years after treatment. This helps explain why a series of clinical trials takes so long to improve survival rates.

3.

Explain that students will now go back in time to the year 1970 and play the roles of doctors trying to improve the survival rates of children with leukemia. Still working in their pairs, students will have the opportunity to design, carry out, and assess the effectiveness of a clinical trial.

3

Over the past 50 years, steady progress has been made in improving the survival rates for children with leukemia. We chose the period around 1970 for this activity because one specific treatment (of the central nervous system, or CNS) led to a very significant gain in

survival rate. Students will see the value of clinical trials when they examine survival rates over time on Master 4.9, *Survival Rates for*

Children with Leukemia.

4.

Give each student pair one copy of Master 4.7, *Treating*

4

Leukemia. This handout describes the treatment options students can include in the clinical trial:

- Three different drugs (A, B, and C) are available. Each drug has been shown to improve the survival rates of patients taking its standard dose. Research also indicates that the best results are achieved when the three drugs are used in combination.
- For each drug, three different doses are available:

standard dose

increased dose

decreased dose

5

Lesson 4

107

- **The CNS treatment follows the drug treatment described above. It involves irradiating the patient's head with X-rays while drug C (methotrexate) is injected into the spinal fluid. This approach is intended to kill cancer cells that may have escaped the effects of the earlier drug treatment and are lurking in the CNS.**

(For print version, skip to Step 5-p on page 110.)

In classrooms using the Web version of the activity:

5-w. Explain that student pairs will use the computer to design and carry out a clinical trial. Before moving to the computers, make the students aware of the following:

- **The standard therapy (control) for treating leukemia is a combination therapy using the standard doses of drugs A, B, and C.**
- **Pairs select the characteristics (drug doses and use or nonuse of the CNS treatment) of the therapy they want to compare with the standard treatment.**
- **After students select the treatment, they submit it, and the trial design is analyzed by the computer software. If the**

trial design is appropriate, then the trial is approved, and the pair can run the trial and learn the results. If a flaw is found in the trial design, then students have an opportunity to correct it and go on to run the trial.

In designing the clinical trial, students may be tempted to use more of everything. Remind students that each treatment is associated with side effects that are sometimes very harmful.

Although proper trial design involves a number of aspects, we

Content Standard A:

are focusing on just one—control of variables. Students should

Students should

understand that a proper design involves changing just one

the dose of *one* of the three drugs while keeping the other two drugs at the standard doses.

Note: After students submit a design that is approved, run the trial, and get the results, they can try other designs by simply changing their selections and resubmitting a new design.

108

Rare Diseases and Scientific Inquiry

6-w. Give one copy of Master 4.8, *Designing a Clinical Trial*, to each student pair. Instruct students to use this handout to record

the treatment options they select as well as the trial results

(survival rate data) and conclusions they draw from the data.

As students design

7-w. Explain that in a clinical trial such as this, the experimental and test the clinical

1

treatment is compared with the standard treatment. Ask,

trials, you have

“Should the clinical trial also include a group that receives no

an opportunity to

treatment?”

assess how well

Students' responses may vary. Students who think just in terms they understand the of good experimental design may respond that including a no-concept of controlling treatment group would better indicate how well the experimental variables. treatment performs. Others may point out that it would not be fair to withhold treatment from a group of patients. In fact, the latter view prevails. For ethical reasons, a no-treatment group would not be included in the design of such a clinical trial.

2

8-w. Direct the students back to their computers and instruct them to click on "Lesson 4: The Importance of Medical Research," then "Activity 2: Clinical Trials."

- Students will see the treatment options and boxes where they can make their selections.**
- After selecting the treatment options, students click the "Submit" button to have the trial design analyzed.**

If the design is judged to be appropriate, then a letter will appear that instructs the students to proceed with the clinical

3

trial. A "Run treatment" button appears. When it is clicked, the trial results are shown on a graph of survival over time.

If the design is judged to not be appropriate, then a letter will appear that reminds the students to change just one

variable at a time. A “Try again” button appears. When it is clicked, the treatment options reappear, and the pair has an opportunity to redesign the trial.

When doctors carry out clinical trials, they first submit the

4

study design to a committee called an institutional review board (IRB). The IRB members discuss the proposed study and decide whether it is designed correctly and meets the ethical standards for experimenting with humans.

9-w. Give pairs about 15 minutes to run the clinical trial, record the results, and draw a conclusion.

The results of each clinical trial are presented as a graph with the percentage of surviving patients on the y-axis and time

5

Lesson 4

109

(in years) on the x-axis. One line on the graph corresponds to the standard treatment (control), and a second line corresponds to the experimental treatment group. On the basis of these data, students should recommend either the standard treatment or the experimental treatment. Students should provide evidence that

supports their recommendation.

Continue with Step 10 on page 112.

In classrooms using the print version of the activity:

5-p. Explain that pairs will design and carry out a clinical trial. Make the students aware of the following:

- The standard therapy (control) for treating leukemia is a combination therapy using the standard doses of drugs A, B, and C.**
- Student pairs select the characteristics (drug doses and use or nonuse of the CNS treatment) of the therapy they want to compare with the standard treatment.**
- After students select the treatment, they submit it to you for analysis. If the trial design is appropriate, then approve the trial and give the pair the results. If you find a flaw in the trial design, then give students an opportunity to correct it before proceeding.**

In designing the clinical trial, students may be tempted to use more of everything. Remind them that each treatment is associated with side effects that are sometimes very harmful.

Although proper trial design involves a number of aspects, we are focusing on just one—control of variables. Students should

Content Standard A:

understand that a proper design involves changing just one variable

Students should

while keeping other variables constant relative to the comparison

develop general

(control) group of patients. Students must remember that their

abilities, such

proposed treatment will be compared with the standard treatment

(using drugs A, B, and C at their standard doses *without* the CNS

as systematic

treatment).

observation,

• Student pairs that decide to use the CNS treatment must keep

making accurate

drugs A, B, and C at the standard doses.

measurements,

• Pairs that decide not to use the CNS treatment can change the

and identifying and

dose of *one* of the three drugs while keeping the other two drugs controlling variables.

at the standard doses.

6-p. Explain that in a clinical trial such as this, the experimental treatment is compared with the standard treatment. Ask,

“Should the clinical trial also include a group that receives no

treatment?”

110

Rare Diseases and Scientific Inquiry

Students' responses may vary. Students who think just in terms of good experimental design may respond that including a no-treatment group would better indicate how well the experimental treatment performs. Others may point out that it would not be fair to withhold treatment from a group of patients. In fact, the latter

As students design

view prevails. For ethical reasons, a no-treatment group would not be included in the design of such a clinical trial.

and test their clinical

1

trials, you have

7a-p. Give each student pair one copy of Master 4.8, *Designing a*

an opportunity to

***Clinical Trial*. Instruct students to**

assess how well

• use Master 4.8 to record the treatment options they select and

they understand the

• submit their design to you for evaluation.

concept of controlling

variables.

Students will need only about five minutes to discuss the trial design and make their selections.

7b-p. Explain that a clinical trial must be approved by an

2

institutional review board (IRB) before it is carried out. The IRB determines whether the trial is both ethical and properly designed. As each pair submits a clinical trial design, check that only one variable is being tested.

A correct design will vary the dose of a single drug or will keep all three drugs at the standard doses and test the effect of the CNS treatment.

8-p. After each pair has submitted a properly designed clinical trial, explain that the trial was performed, and you have the results.

3

Give each student pair the appropriate handout:

• Pairs that chose to test the dose of drug A receive Master

4.13, *Changing the Dose of Drug A.*

• Pairs that chose to test the dose of drug B receive Master

4.14, *Changing the Dose of Drug B.*

• Pairs that chose to test the dose of drug C receive Master

4.15, *Changing the Dose of Drug C.*

• Pairs that chose to test the effect of the CNS treatment receive

Master 4.16, *Central Nervous System Treatment.*

4

The results of each clinical trial are presented as a graph with

the percentage of surviving patients on the y-axis and time (in years) on the x-axis. One line on the

graph corresponds to the standard treatment (control), and a second line corresponds to the experimental treatment group.

9-p. Instruct student pairs to summarize the data on Master 4.8 in the box labeled “Clinical Trial Results.” On the basis of the results, students should recommend treating Hanna with the standard treatment or the experimental treatment. They should

5

Lesson 4

111

state their recommendation and explain their reasoning in the box labeled “Conclusion from the Clinical Trial.”

If pairs chose to vary the dose of one of the three drugs, the results will show little difference between the standard treatment (control) and the experimental treatment (altered dose). Students should look at the graph on the handout and estimate the five-year survival rates for the control and experimental groups of patients.

If pairs chose to test the effect of the CNS treatment, they will see a significant difference between the control and experimental groups.

10. Reconvene the class and ask for volunteers to report which treatment they compared with the standard treatment and to indicate whether their treatment was better or worse than the standard treatment.

Keep track of and display results as they are reported. Changing the

dose of one of the three drugs used to treat leukemia produces only modest differences when compared with the standard treatment.

In contrast, the CNS treatment produces much greater gains in the survival rate.

11. Give each student one copy of Master 4.9, *Survival Rates for*

***Children with Leukemia*. Explain that the doctor showed this graph to Jason and Kim to help them understand how effective**

clinical trials have been in improving the survival rates of children with leukemia.

Master 4.9 is a graph depicting how survival rates of children with leukemia have improved over the past 50 years. Ask questions

to gauge students' understanding of the graph. The main point of

the graph is that studies carried out in the past showed five-year

survival rates that were lower than studies conducted more recently.

This means that the results of earlier clinical trials have been

successfully used to improve the survival rates of patients.

12. Ask students to think back to the Web search they

performed during the first part of the lesson. Remind them

that they evaluated the results to find the hits most likely to

give them relevant and accurate information about childhood

leukemia. Ask, "What other results from the Web search

could give us a different type of perspective about childhood

leukemia?"

Some students will likely suggest that the leukemia blog would

provide a patient's perspective on the disease.

(For print version, skip to Step 13-p on page 114.)

In classrooms using the Web version of the activity:

13-w. Acknowledge that blogs and videos created by cancer survivors can offer an important perspective on what it's like to live and cope with leukemia. Conclude the lesson

1

by explaining that students will watch a brief video called "Hailey's Story." It was made by a young woman who was diagnosed with childhood leukemia when she was in middle school. Before directing the pairs to their computers, instruct students to write in their notebooks some questions that they would like to ask Hailey about her experiences.

14-w. Direct the students to their computers and instruct them to click on "Lesson 4: The Importance of Medical Research," and then "Activity 2: Hailey's Story."

2

The video is brief, five minutes long. If you have the ability to project the computer image, it may be simpler to watch the video

as a group.

15-w. After student pairs have watched the video, reconvene the class. Ask for volunteers to describe their reactions to the video and how it addressed (or did not address) the questions they wrote in their notebooks.

During the video, Hailey mentions that the Leukemia and

3

Lymphoma Society presented her with the Spirit of Tom Landry Award. Tom Landry was the coach of the Dallas Cowboys football team. He died from leukemia in 2000.

Hailey mentions that she wants to fight cancer by becoming a pediatric oncologist. You may need to explain to the class that a pediatric oncologist is a doctor who treats cancer in children.

The video will not answer all of the students' questions. Suggest that they perform a Web search to access information from foundations

4

and patient support groups that can answer their questions.

Note: In the video, Hailey mentions that more than 12,000 children and teenagers will be diagnosed with cancer this year and that about 1 in

3 will die from it. Students may find this confusing since the graph on Master 4.9 shows a current survival rate of about 90 percent. Explain

that the lower survival rate Hailey mentioned comes from combining

the survival rates from all forms of cancer and not just leukemia, which responds better to treatment.

End of Web-based activity.

5

Lesson 4

In classrooms using the print version of the activity:

13-p. Acknowledge that blogs and videos created by cancer survivors can offer an important perspective on what it's like to live and cope with the illness. Conclude the lesson by explaining that the class will conduct a brief interview with a high school senior who was diagnosed with leukemia when she was in eighth grade.

Note: During the interview, Hailey mentions missing a year of school.

As she explains in her video, she missed school while undergoing chemotherapy and kept up with her studies with the help of a tutor.

14-p. Explain that the interview is based on the words of an actual cancer survivor named Hailey. Ask for one volunteer to ask the questions and another to play Hailey and read her responses.

Students may become interested in Hailey's story and want to see her video. If so, give them the link to the Web site.

15-p. Give the student interviewer and the student playing Hailey

each a copy of Master 4.17, *Interview with Hailey*. Instruct the two student actors to come to the front of the room and conduct the interview.

During the interview, Hailey mentions that the Leukemia and Lymphoma Society presented her with the Spirit of Tom Landry Award. Tom Landry was the coach of the Dallas Cowboys football team. He died from leukemia in 2000.

Hailey mentions that she wants to fight cancer by becoming a pediatric oncologist. You may need to explain to the class that a

pediatric oncologist is a doctor who treats cancer in children.

16-p. After the student actors return to their seats, ask for volunteers to describe their reactions to the interview.

Students may still have questions about leukemia. Suggest that they perform a Web search to access information from foundations and patient support groups that can answer their questions.

114

Rare Diseases and Scientific Inquiry

Lesson 4 Organizer: Web Version

Activity 1: *An Unwelcome Diagnosis*

1

Estimated time: 100 minutes

Page and Step

Explain that students will explore a case study of a child who has Page 98 a rare disease.

Steps 1

- **Display Master 4.1.**

and 2

- **Ask volunteers to read paragraphs aloud to the class.**

Ask, “What would you do now that you have learned that your

Page 98

daughter has been diagnosed with leukemia?”

Step 3

Explain that after the upsetting visit to the doctor, Jason and Kim

Page 98

performed an Internet search on leukemia.

Step 4

2

Ask students:

Page 99

- **“If you were Hanna’s parent, what information would you**

Step 5

want to have about the disease?”

- **“Where could you find that information?”**

Give each student a copy of Masters 4.2 and 4.3. Instruct Page 99

students to rank on Master 4.3 the usefulness of the hits listed

Step 6

on Master 4.2.

Display Master 4.3. Ask volunteers to report how they ranked Page 101

3

the Web hits.

Step 7

Arrange the class in pairs. Give each pair a copy of Master

Page 102

4.4. Explain that students will now access information about

Step 8-w

leukemia from Hits 1 and 4 from the Internet search and summarize on Master 4.4 what they learn.

Instruct students to click on “Activity 1: An Unwelcome

Page 102

Diagnosis” and then on “Activity 1: Simulated Web Search.”

Step 9-w

Reconvene the class and ask whether students have questions

Page 102

4

about the information from the Web hits.

Step 10

Remind students about the three general causes of disease.

Page 103

Ask, “What types of information would you want to have in

Steps 11 and 12

order to decide which of the three causes of disease applies to leukemia?”

5

Lesson 4

115

Explain that Jason and Kim have two children: Hanna, who has

Page 103

leukemia, and Rick, her healthy older brother. Also, say that

Steps 13 and 14

there's no history of leukemia in the family. Ask,

- **“Does this rule out genetics as the cause of leukemia?”**
- **“What about environmental exposure or infections?”**

Acknowledge that so far, there isn't good evidence to suggest

Page 103

a cause for Hanna's leukemia. Remind students about the

Step 15

Animation about Leukemia. Ask, “What happened to a stem cell that led to leukemia?”

Explain that new mutations happen from exposure to sunlight

Page 103

and substances in the environment or from an uncorrected

Step 16

DNA-copying mistake. Mutations in genes associated with cell growth can lead to cancer.

Explain that mutations can affect the number and appearance

Page 104

of chromosomes and that a photograph of chromosomes under

Step 17

a microscope is a karyotype. Give each student a copy of

Master 4.5.

Instruct students to read Master 4.5 and answer the question

Page 104

at the bottom. Explain that in leukemia, we expect a karyotype

Steps 18 and 19

to show three, not two, copies of one or more of the numbered

(nonsex) chromosomes.

Direct student pairs back to the computers. Explain that they will

Page 105

view karyotypes from Hanna and her immediate family. Instruct

Step 20-w

students to predict whether each karyotype will appear normal

or abnormal.

Instruct students to click on “Activity 1: An Unwelcome

Page 105

Diagnosis” and then on “Activity 1: Karyotypes.”

Step 21-w

Explain that the link labeled “View All of Hanna’s Karyotypes”

Page 105

displays karyotypes from three cell types: blood, cheek, and hair

Step 22-w

follicles. Ask pairs to predict how each karyotype will appear and to record their predictions in their notebooks.

Ask, “How can you account for the appearance of the karyotypes

Page 105

taken from these three different tissues?”

Step 23-w

116

Rare Diseases and Scientific Inquiry

Activity 2: *Clinical Trials*

Estimated time: 50 minutes

Page and Step

Display Master 4.6. Ask volunteers to read it aloud.

Page 107

Step 1

1

Explain that doctors compare the effectiveness of cancer

Page 107

treatments by looking at the percentages of patients still alive

Step 2

after five years.

Explain that students will go back to the year 1970 and assume

Page 107

the roles of doctors trying to improve the survival rates of

Step 3

children with leukemia by conducting a clinical trial.

Give each student pair a copy of Master 4.7. Explain that it

Page 107

describes the treatment options they can include in their clinical

Step 4

trial.

2

Explain that student pairs will use computers to design and carry out their clinical trial. Explain that

Step 5-w

- The standard therapy is a combination of the standard doses of drugs A, B, and C.**
- Pairs will select drug doses and the use or nonuse of the central nervous system treatment.**
- They will submit the design for approval. Once approved, the trial will be carried out and students will learn the results.**

Give each pair a copy of Master 4.8 . Instruct students to record

3

their treatment options, trial results, and conclusions on it.

Step 6-w

Explain that in a clinical trial such as this, the experimental

Page 109

treatment is compared with the standard treatment. Ask, “Should Step 7-w the clinical trial also include a group that receives no treatment?”

Direct students to their computers and instruct them to click

Page 109

on “Activity 2: Clinical Trials.” Student pairs should select the

Steps 8-w

treatments and then click “Submit.”

and 9-w

- If approved, students can click “Run treatment” and learn**

4

the results.

- **If rejected, students can redesign the trial.**
- **After recording the trial results, students should make and record their conclusions.**

Reconvene the class. Ask volunteers to report the designs and

Page 112

results of the trials and how their treatment compared with the

Step 10

standard treatment.

5

Lesson 4

117

Give each student a copy of Master 4.9 and explain that this is

Page 112

what the doctor showed Hanna's parents to help them see how

Step 11

effective clinical trials have been in improving survival rates of children with leukemia.

Remind students of the Web search they performed about

leukemia. Ask, “What other results from the Web search

Step 12

could provide us with a different perspective about childhood

leukemia?”

Conclude the lesson by explaining that students will watch

Page 113

a brief video created by a young woman who is a leukemia

Step 13-w

survivor. Ask students to write in their notebooks some

questions they would like to ask the young woman about her

experiences.

Instruct students to click on “Activity 2: Hailey’s Story” and watch Page 113

the video.

Step 14-w

Reconvene the class and ask volunteers to describe their

Page 113

reactions to the video and to explain how it addressed (or did

Step 15-w

not address) the questions they wrote in their notebooks.

= Involves making a transparency.

= Involves copying a master.

= Involves using the Internet.

Lesson 4 Organizer: Print Version

Activity 1: *An Unwelcome Diagnosis*

Estimated time: 100 minutes

Page and Step

1

Explain that students will explore a case study of a child who has a

Page 98

rare disease.

Steps 1

- Display Master 4.1.**

and 2

Arrange the class in pairs. Give each pair a copy of Masters 4.4 and Page 102

3

4.10. Ask students to read Master 4.10 and summarize the information Steps 8-p

on Master 4.4.

and 9-p

Reconvene the class and ask whether students have questions about

Page 102

the information from the Web hits.

Step 10

Remind students about the three general causes of disease. Ask, “What Page 103

types of information would you want to have in order to decide which

Steps 11 and 12

of the three causes of disease applies to leukemia?”

Explain that Jason and Kim have two children: Hanna, who has

Page 103

leukemia, and Rick, her healthy older brother. Also, say that there’s no Steps 13 and 14

4

history of leukemia in the family. Ask,

- **“Does this rule out genetics as the cause of leukemia?”**
- **“What about environmental exposure or infections?”**

Acknowledge that so far, there isn’t good evidence to suggest a cause

Page 103

for Hanna’s leukemia. Remind students about the Animation about

Step 15

Leukemia. Ask, “What happened to a stem cell that led to leukemia?”

5

Lesson 4

119

Explain that new mutations happen from exposure to sunlight and

Page 103

substances in the environment or from an uncorrected DNA-copying

Step 16

mistake. Mutations in genes associated with cell growth can lead to cancer.

Explain that mutations can affect the number and appearance of

Page 104

chromosomes and that a photograph of chromosomes under a

Step 17

microscope is a karyotype. Give each student a copy of Master 4.5.

Instruct students to read Master 4.5 and answer the question at the Page 104

bottom. Explain that in leukemia, we expect a karyotype to show

Steps 18 and 19

three, not two, copies of at least one of the numbered (nonsex)

chromosomes.

Explain that students will now view karyotypes from Hanna and her

Page 106

immediate family. Ask students to predict whether each karyotype will

Step 20-p

appear normal or abnormal and to record in their notebooks whether

the evidence supports the predictions.

Give each student pair a copy of Master 4.11. Ask them to note

Page 106

whether their predictions were confirmed.

Step 21-p

Explain that students will now look at three different karyotypes from

Page 106

Hanna: from her blood, cheek, and hair follicles. Ask pairs to predict

Step 22a-p

how each karyotype will appear and to record their predictions.

Give each student pair a copy of Master 4.12. Ask students to note Page 106

whether their predictions were confirmed.

Step 22b-p

Ask, “How can you account for the appearance of the karyotypes taken

Page 106

from these three different tissues?”

Step 23-p

120

Rare Diseases and Scientific Inquiry

Activity 2: *Clinical Trials*

Estimated time: 50 minutes

Page and Step

Display Master 4.6. Ask volunteers to read it aloud.

Page 107

Step 1

1

Explain that doctors compare the effectiveness of cancer treatments by

Page 107

looking at the percentages of patients still alive

Step 2

after five years.

Explain that students will go back to the year 1970 and assume the

Page 107

roles of doctors trying to improve the survival rates of children with

Step 3

leukemia by conducting a clinical trial.

Give each student pair a copy of Master 4.7. Explain that it describes Page 107

the treatment options they can include in their trial.

Step 4

Tell students that they will work in their pairs to design and carry out a Page 110

2

clinical trial. Explain that

Step 5-p

- the standard therapy is a combination of the standard doses of drugs A, B, and C,
- pairs will select drug doses and the use or nonuse of the central nervous system treatment, and
- they will submit the design to you for analysis.

Explain that in clinical trials, an experimental treatment is compared

Page 110

with the standard treatment. Ask, “Should the clinical trial also include Step 6-p a group that receives no treatment?”

3

Give each pair a copy of Master 4.8 . Instruct students to record on it Page 111 the treatment options they select, and then to submit it to you. Explain Steps 7a-p what an Institutional Review Board is, and check that student designs and 7b-p test only one variable.

Once you’ve approved all the clinical trial designs, give each student

Page 111

pair the appropriate handout (Master 4.13, 4.14, 4.15, Step 8-p or 4.16)

Ask student pairs to summarize the data and their conclusions and

Page 111

reasoning on Master 4.8.

Step 9-p

4

Reconvene the class and ask volunteers to report which treatment they Page 112

used and whether it was better than the standard one.

Step 10

Give each student a copy of Master 4.9 and explain that this is what Page 112 the doctor showed Hanna’s parents to help them see how effective

Step 11

clinical trials have been in improving survival rates of children with leukemia.

Remind students of the Web search they performed about leukemia.

Page 112

Ask, “What other results from the Web search could give us a different

Step 12

perspective about childhood leukemia?”

5

Lesson 4

121

Acknowledge that blogs and videos by cancer survivors can offer

Page 114

important perspectives on what it’s like to live with that illness.

Step 13-p

Conclude by explaining that the class will conduct a brief interview with a high school senior who was diagnosed with leukemia in eighth grade.

Ask for one volunteer to play Hailey and one to play the interviewer,

Page 114

give each of them a copy of Master 4.17, and have them conduct the Steps 14-p

interview in front of the class.

and 15-p

Ask volunteers to describe their reactions to the interview.

Page 114

Step 16-p

= Involves making a transparency.

= Involves copying a master.

122

Rare Diseases and Scientific Inquiry

Lesson 5

Communicating about Rare Diseases

1

2

Evaluate

At a Glance

Overview

Lesson 5 gives students the opportunity to reflect on what they have

3

learned about rare diseases and scientific inquiry during this supplement.

Students role-play staff members of a patient-support organization and

are tasked with creating informational posters for the public about Marfan syndrome and childhood leukemia. After students create the posters, they evaluate another poster for a different disease. Finally, students return to the reality TV show scenario that began the supplement. They revisit their initial ideas about rare disease and their attitudes toward people affected by them. They reexamine their answers to the questions about rare diseases posed in Lesson 1 and discuss how their thinking has changed.

4

Major Concepts

• Diseases have three main causes:

– genetics

– environmental exposure

– infectious agents

• Rare diseases may become common, and common diseases may become rare.

• Some rare diseases can be cured, while many others can be managed through treatment.

• People with rare diseases must sometimes cope with the stigma associated with their condition.

5

123

Objectives

After completing this lesson, students will have

• revisited their preconceptions about the nature of disease in light of scientific conceptions,

• summarized information about childhood leukemia and Marfan

syndrome, and

- **considered their feelings about people affected by rare diseases.**

Teacher Background

Consult the following sections in Information about Rare Diseases and

Scientific Inquiry:

2.0 The Impact of Genomics on Rare Diseases (pages 24–26)

3.0 Rare Infectious Diseases (page 26)

4.0 Rare Diseases Caused by Environmental Toxins (pages 27–28)

5.1 Necrotizing Fasciitis (pages 28–29)

5.2 Marfan Syndrome (pages 29–31)

5.3 Childhood Leukemia (pages 31–33)

Activity 2: Reflecting on Rare Diseases

For Classes Using the Print-Based Version

1 copy of Master 5.6 for each student

1 transparency of Master 5.7

1

Equipment and Materials

For Activity 1, students will need chart paper and colored marking pens.

For Activity 2, Web-based version, students will need computers with Internet access.

Preparation

Activity 1

Gather chart paper and colored marking pens for each student pair. Make photocopies and transparencies.

2

Activity 2

For classrooms using the Web version, verify that the computer lab is reserved for your class or that classroom computers are set up for the activities. Refer to Using the Web Site for details about the site. Check that the Internet connection is working properly.

Log on to the Web Portion of Student Activities section of the site at

3

<http://science.education.nih.gov/supplements/rarediseases/student>

Select “Lesson 5: Communicating about Rare Diseases” so students can begin the activity right away.

Procedure

Activity 1: *Creating an Informational Poster*

4

Estimated time: 50 minutes

Note: This is an Evaluate lesson. It’s not designed to teach new content but rather to give you a chance to assess how well students

have learned the major concepts about rare diseases and scientific inquiry.

1.

Begin by explaining that in this final lesson of the supplement,

students will play the roles of staff members working for an

5

Lesson 5

125

organization that informs and support patients with rare

diseases and their families. Explain the following:

- Many rare diseases have support groups that raise awareness and money to support research about the disease.

- The task is for pairs to prepare informational posters that

Content Standard C:

explain important aspects of a rare disease to patients, family

Disease is a

members, and other interested people.

breakdown in

structures of functions

Students may feel unqualified to prepare informational posters

**of an organism. Some
about rare diseases. You can explain that the posters will deal with
diseases are the result
the rare diseases they have been studying. Furthermore, the goal
of the poster is to communicate information to the public, so the
of intrinsic failures of
posters should use language that everyone can understand.**

**the system. Others are
the result of damage**

2.

**Arrange students into pairs again. Explain that each pair will
by infection by other
create a poster about childhood leukemia or Marfan syndrome.
organisms.**

**Assign half of the pairs to childhood leukemia and the other
half to Marfan syndrome. Explain that after each pair creates a
poster, they will evaluate a poster about the other rare disease.**

**You may allow student pairs to select the disease they prefer. If
selections heavily favor one disease over the other, you may need to
instruct some pairs to switch diseases to maintain a balance between
the two.**

**Tip from the field test: If your classroom has the
technical capacity, consider allowing students to create
a PowerPoint presentation instead of a poster.**

3.

Display Master 5.1, *Guidelines for the Poster*, and give each pair a copy to use as a reference. Explain that the handout lists

Content Standard A:

the types of information that should be in the poster. Briefly

Students should base

go over the items on the handout and answer any questions

their explanations on

students have.

what they observed,

and as they develop

Make sure that students have access to the notebooks that contain

cognitive skills,

their work from previous lessons. This work will help students

complete the first part of the poster.

they should be

able to differentiate

Note: The purpose of this activity is to assess students' learning from the explanation from previous lessons. Therefore, do not allow students to conduct a research description—proving project using the Internet or other outside resources.

causes for effects

and establishing

4.

Explain that the second part of the poster will contain a brief

summary of a recent clinical trial or research study about the

relationships based

disease. Give each student pair one copy of Master 5.2, *Research*

on evidence and

Study on Marfan Syndrome, or Master 5.3, Clinical Trial on

logical argument.

Childhood Leukemia, depending on student preference.

126

Rare Diseases and Scientific Inquiry

These handouts contain the information needed to complete the second part of the poster.

Marfan study

Students should conclude that the drug losartan helped keep the aortas of mice with the Marfan mutation at a healthy size. This suggests that

1

the drug also may be able to help humans with Marfan syndrome.

Leukemia clinical trial

Students should conclude that the survival rate of patients who received drug combination therapy with brain irradiation was essentially the same as that of patients who received combination drug therapy alone. This means that patients can be spared the brain irradiation and the risk of its harmful side effects.

5.

Display Master 5.4,

2

***Evaluation Rubric.* Explain that student**

pairs will use it to evaluate the poster created by another pair.

Briefly go over the criteria on the handout.

It's important to provide the pairs with evaluation criteria before they create the posters. Otherwise, they may feel that it is unfair to be given this information after it's too late to revise the posters.

6.

Make available to pairs chart paper and colored marking pens.

Explain that pairs will first make an outline of the information they plan to include on the poster. When they are satisfied with

3

it, they should transfer it to a piece of chart paper.

7.

As the student pairs work, circulate around the room and assign a code number to each poster.

Allow students at least 15 minutes to complete this task. The code number allows you to know which students worked on which poster and prevents the students from knowing who created the poster they will evaluate.

8.

After student pairs have completed the posters and each has

4

been assigned a code number, collect all posters.

Place the posters about childhood leukemia in one pile and those about Marfan syndrome in another pile.

9.

Give each pair a poster to evaluate. Make sure that each pair evaluates a poster about the rare disease they did not create a

poster for.

If multiple classes will be making posters, consider having one class

5

serve as peer reviewers for another class.

Lesson 5

127

10. Give each student pair one copy each of Master 5.4 and Master 5.5, *Poster Score Sheet*.

Give students about 20 minutes to complete the evaluation, and then collect the score sheets. Of course, the students' explanations for their scores are more revealing than the numbers themselves.

Activity 2: Reflecting on Rare Diseases

Estimated time: 50 minutes

1.

Remind the class about the producer of the reality TV show who wanted to film a student with a rare disease joining the class.

Instruct students to look in their notebooks where, in Lesson 1, they wrote down questions they would ask the student with the rare disease.

(For print version, skip to Step 2-p on page 130.)

In classrooms using the Web-based activity:

2-w. Explain that student pairs will go to their computers and watch a video made by a young man with Marfan syndrome.

Instruct students to keep in mind the questions they posed and the feelings they expressed about rare diseases and the people affected by them.

Computers should be at the URL:

<http://science.education.nih.gov/supplements/rarediseases/student>

This is a menu page that contains a link for this activity.

3-w. Direct students to their computer stations and instruct them to click on “Lesson 5: Communicating about Rare Diseases.”

The video is about 12 minutes long and illustrates the story of Kevin, a young man who has Marfan syndrome.

4-w. After they have watched the video, allow students to express their feelings about it.

If students focus on feelings of sorrow or pity, call attention to comments made by Kevin’s mother about how important he is to their family and to those around him. Marfan syndrome certainly has affected him, but not only in negative ways. It has helped Kevin direct his life.

128

Rare Diseases and Scientific Inquiry

5-w. Ask for volunteers to read from their notebooks

• a question they wanted to ask the student with the rare

disease or

- a feeling they expressed about having the student join the class.

1

If their thinking has changed since the beginning of the supplement, ask them to explain how and why.

The point of this step is to revisit questions, concerns, and fears about people with rare diseases that students expressed at the start of the supplement. We hope that after learning about rare diseases and hearing from people who live with them, students become more empathetic and sensitive to those who cope with rare diseases.

6-w. Explain that you want to conclude the supplement by

2

revisiting the students' initial ideas about disease. Give each student one copy of Master 5.6, *What Do You Think*

***Now?* Instruct students to answer each question on the handout.**

Give students 5–10 minutes to answer the questions. Students may recognize that they answered these questions during the Lesson 1.

Answering the same questions gives them the opportunity to reflect on how their thinking has changed as a consequence of participating in the supplement.

3

7-w. Have students retrieve the copy of Master 1.2, *Thinking about*

***Disease*, that they filled out in Lesson 1. Instruct students to compare the answers they just wrote with those on Master 1.2.**

8-w. After students have had a chance to compare both sets of answers, ask the following:

- **“Have any of your answers changed since Lesson 1?”**
- **“If so, what caused your thinking to change?”**

Allow different students to respond. Some of the students’ answers

4

to the questions will probably have changed. Even if some students’ attitudes are essentially the same, the knowledge gained during the supplement may influence their opinions later, after they have had more experiences.

End of Web-based activity.

5

Lesson 5

129

In classroom using the print version of the activity:

2-p. Display Master 5.7, *Another Letter from the Producer*.

Ask for a volunteer to read it aloud to the class.

3-p. Remind students that during Lesson 1, they wrote in their notebooks some questions they would ask a student with a rare disease who was about to join the class. Instruct students to look back at the questions they posed and the feelings they expressed about sharing their classroom with this student.

4-p. Explain that you wonder whether participating in the lessons in this supplement has caused anyone to change their attitude

about people with rare disease. Ask for volunteers to read from their notebooks

- **a question they wanted to ask the student with a rare disease**

or

- **a feeling they expressed about having the student join the class.**

If their thinking has changed since the beginning of the supplement, ask them to explain how and why.

The point of this step is to revisit questions, concerns, and fears about people with rare diseases that students expressed at the start of the supplement. We hope that after learning about rare diseases and hearing from people who live with them, students become more empathetic and sensitive to those who cope with rare diseases.

5-p. Explain that you want to conclude the supplement by revisiting the students' initial ideas about disease. Give each student one

copy of Master 5.6, *What Do You Think Now?* Instruct students to answer each question on the handout.

Give students 5–10 minutes to answer the questions. Students may recognize that they answered these questions during the Lesson 1.

Answering the same questions gives them an opportunity to reflect on how their thinking has changed as a consequence of participating in the supplement.

6-p. Have students retrieve the copy of Master 1.2, *Thinking about*

***Disease*, they filled out in Lesson 1. Instruct them to compare the answers on Master 5.6 with those on Master 1.2.**

7-p. After students have had a chance to compare both sets of answers, ask the following:

- “Have any of your answers changed since Lesson 1?”
- “If so, what caused your thinking to change?”

Allow different students to respond. Some of the students’ answers to the questions will probably have changed. Even if some students’

1

attitudes are essentially the same, the knowledge gained during the supplement may influence their opinions later, after they have had more experiences.

5

Lesson 5

131

Lesson 5 Organizer: Web Version

Activity 1: *Creating an Informational Poster*

Estimated time: 50 minutes

Page and Step

Explain that students will play the roles of staff members

Page 125

working for a patient support group. Student pairs will prepare Step 1 informational posters for the public.

Arrange the class in pairs again. Explain that each pair will

Page 126

make a poster about a rare disease (half will address Marfan

Step 2

syndrome and half will address childhood leukemia) and then evaluate another pair's poster.

Display Master 5.1 and give each pair a copy.

Page 126

Go over the master and answer students' questions.

Step 3

Explain that the second part of the poster will contain a

summary of a clinical trial or research study. Give each pair

Step 4

a copy of either Master 5.2 or Master 5.3, depending on student preference.

Display Master 5.4, and explain that students will use it to Page 127

evaluate another pair's poster.

Step 5

Give pairs chart paper and marking pens.

Page 127

- **Instruct students to first make an outline of the poster,**

Steps 6–8

then transfer it to the chart paper.

- **Circulate around the room and assign a code number to each poster.**

- **When students have finished, collect the posters.**

Give each pair a poster of the disease they did not work on.

Page 127

Step 9

Give each pair a copy of Masters 5.4 and 5.5. After students Page 128

have completed the work, collect the score sheets.

Step 10

132

Rare Diseases and Scientific Inquiry

Activity 2: *Reflecting on Rare Diseases*

Estimated time: 50 minutes

Page and Step

Remind the class about the reality TV scenario from Lesson 1.

Page 128

Instruct students to retrieve the questions and feelings about

Step 1

the scenario they recorded in their notebooks.

1

Tell students to watch a video on their computers made

Pages 128

by a young man who has Marfan syndrome (at “Lesson 5:

Steps 2w–4w

Communicating about Rare Diseases”). Afterwards, allow

students to express their feelings about the video.

Ask volunteers to read from their notebooks

Page 129

• a question they wanted to ask the student with the rare

Step 5-w

disease or

- a feeling they expressed about having the student join their class.

2

If their thinking has changed since the beginning of the supplement, ask them to explain how and why.

Revisit students' initial ideas about disease.

Page 129

Give every student a copy of Master 5.6, and instruct them to

Step 6-w

answer the questions on it.

Have students retrieve their copies of Master 1.2 and

Page 129

compare these answers with those on Master 5.6.

Step 7-w

Conclude by asking,

Page 129

- “Have any of your answers changed since Lesson 1?”

Step 8-w

3

- “If so, what caused your thinking to change?”

= Involves making a transparency.

= Involves copying a master.

= Involves using the Internet.

PEOPLE REALITY

Productions

A large, stylized handwritten signature in black ink that reads 'Vincent Shifflett'. The signature is written in a cursive, flowing style and is set against a light gray, semi-transparent background.

Letter from a Producer

Dear Principal:

I am a producer for People Reality Productions, a company that develops reality television shows for broadcast over several cable TV channels. We are thinking about creating a series that follows the life of a student who has a rare disease.

We are still working out the details of the series. At this point, we haven't identified the student who will participate or even which rare disease will be featured in the series. As a first step, we are interested in learning what concerns and questions your teachers and students have about a student with a rare disease joining their class.

Please share this letter with your teachers. After they have had a chance to discuss it with their students, I will call you to learn about their thoughts and concerns.

Thank you for your help with this project.

Sincerely,

Vincent Shifflett

Senior Producer

Thinking about Disease

Name:

Questions

- 1. What is a disease?**
- 2. How do doctors tell if someone has a disease?**
- 3. What do you think causes disease?**
- 4. Make a list of list 10 different diseases.**

Table 1. List of Diseases

- 5. What does it mean to call a disease “rare”?**
- 6. In simple terms, curing a disease means that the patient has been restored to good health and there is little chance of the disease coming back.**

It is not possible to cure all diseases. Controlling a disease means that the disease symptoms are lessened and the quality of the life for the patient is improved, but the disease has not been cured.

Which of the diseases you listed in Step 4 do you think are curable, controllable, or incurable?

Follow-up on Week 1 Infirmery Visits

Summary of Patients' Responses to Treatment from Week 1

• Six soldiers from Barracks A with pinkeye tested positive for infection by bacterial species C. They were treated with eyedrops containing antibiotics.

In all cases, the infection has cleared up.

• Six soldiers from Barracks G with sore throats tested positive for infection by bacterial species A. They were treated with antibiotics. Although two soldiers returned to the infirmery, all are responding to the antibiotics and the infections have largely disappeared.

• Four soldiers developed blisters from wearing new boots. Three of the four tested positive for infection by bacterial species A, and the fourth soldier tested negative for species A, B, and C. One soldier received a cut on the left leg, which was closed with stitches. He has no evidence of infection.

• One soldier twisted his ankle. X-rays showed no broken bones. The ankle was bandaged, and the soldier has been assigned to light duty.

• Two soldiers from Barracks E tested positive for exposure to poison ivy. They were treated with steroid cream, and the skin rashes are disappearing.

• One soldier, who was short of breath, was diagnosed as having asthma and was given an inhaler, which eased her symptoms.

Medical Reference Manual:

Necrotizing Fasciitis (Flesh-Eating Bacteria)

What is it?

Flesh-eating disease is a bacterial infection that destroys skin and fat tissue. The disease is very rare. The odds of getting it are about 1 in 100,000. However, it is very serious. About 2 out of 10 people who get this infection die from it.

What causes it?

The disease can be caused by different species of bacteria, including the one that causes strep throat. The bacteria enter the body through open wounds, where they interact with the immune system to produce the disease. Flesh-eating disease is rare because the immune system of most people will stop the infection before it becomes serious.

What are the symptoms?

The skin reddens, becomes swollen, and is painful to the touch. Other symptoms include nausea,

vomiting, and diarrhea. The symptoms start suddenly, may get better for a day or two, then quickly worsen. If not treated, the disease may result in organ failure and death.

Figure 1. Early infection. (Donald E. Low, University

Figure 2. Late infection. (Donald E. Low,

Health Network/Mount Sinai Hospital)

University Health Network/Mount Sinai Hospital)

How is it treated?

Patients with flesh-eating disease need immediate hospital care. Treatment involves antibiotics and surgery to remove diseased tissue and stop the spread of the disease.

To Play or Not to Play?

Patrick is a 13-year-old middle school student who loves to play basketball. He came home excited from school and explained to his parents that the school basketball team will be holding tryouts next month and he wants to participate.

Patrick's parents are both happy and concerned for him. They are happy because they know Patrick loves sports, and they feel that the exercise will be good for him. They also know that Patrick has been occasionally teased because he is tall and thin. Maybe by joining the basketball team he will make new friends and feel more accepted by his classmates.

Patrick's parents are concerned because he has some health problems. When Patrick was a toddler, the family doctor diagnosed him with a heart murmur.

The doctor explained that a heart murmur refers to a sound that the blood makes as it flows through the heart. She further explained that heart murmurs are usually harmless and that Patrick could lead a normal life.

When he was nine, Patrick developed a problem with his eyesight, and it was discovered that one of his eye lenses was detached and had to be repaired.

When Patrick was 10, he was diagnosed with asthma. The doctor explained that asthma causes the tubes carrying air in and out of the lungs to become sore and swollen. This can cause coughing and wheezing and make it difficult to breathe.

The doctor created a treatment plan for Patrick that helped him recognize his symptoms and use an inhaler to make breathing easier. She also explained that, with proper management of his asthma, Patrick could play sports and that the exercise might even improve his condition.

Finally, just last year, Patrick was diagnosed with scoliosis, or curvature of the spine. The doctor explained that Patrick's scoliosis was moderate and, as with most children, the cause was unknown. He further explained that in 90 percent of cases, no future treatment is needed.

(Page 1 of 2)

Heart murmur

When doctors use a stethoscope to listen to the heartbeat, they hear a lub-DUB sound made by heart valves opening and closing as blood flows through the heart. The term

“heart murmur” refers to an unusual whooshing sound doctors hear when listening to the heartbeat.

Doctors diagnosis heart murmurs in many children at some point in their lives. Most heart murmurs are harmless and need no treatment. Other heart murmurs are called abnormal and may be associated with defects in the heart that were present at birth.

Mitral valve prolapse

In the condition called mitral valve prolapse, one of the heart’s valves doesn’t work properly. The valve flaps are “floppy” and don’t close properly. This sometimes causes blood to flow backward from its normal direction. This backflow of blood may be associated with shortness of breath or chest pain.

The cause of mitral valve prolapse is not known. Most people with the condition are born with it. It tends to run in families and is associated with connective tissue disorders such as Marfan syndrome.

Figure 1. Mitral valve prolapse.

**The mitral valve
is a valve that lies

Medical Reference Manual: *Vision System*

Myopia (nearsightedness)

Nearsightedness is caused by a change in the shape of the eyeball so that it is egg shaped instead of round. This egg-shaped eyeball focuses light a little in front of the retina instead of directly on it, resulting in blurry vision. Myopia is a common condition affecting 30 to 40 percent of the American population.

Detached lens

A detached, or dislocated, lens means that the lens has shifted from its normal position (centered behind the pupil). If the dislocation is moderate, the problem may be corrected with glasses. A severe lens dislocation may require surgery to correct.

Detached lenses are rare in the general population. They are often caused by a blow to the eye. The condition is much more common among people with certain diseases involving connective tissue such as Ehlers-Danlos syndrome and Marfan syndrome.

Medical Reference Manual: *Skeletal System*

Scoliosis (curvature of the spine)

Scoliosis refers to an abnormal curvature of the spine. About 10 percent of adolescents show some degree of scoliosis, but less than 1 percent need treatment for the condition. The severity of scoliosis is described by the extent of the curvature.

Table 1. Severity of Scoliosis

Amount of Curvature

Severity

Curvature less than 20 degrees

Mild

Curvature between 20 and 70 degrees Moderate

Curvature greater than 70 degrees

Severe

Patients with mild scoliosis usually don't require treatment beyond examination to see whether the condition worsens. Patients with moderate and severe scoliosis are treated with back braces or surgery.

In most cases, the cause of scoliosis is not known; however, it does seem to run in families. In some cases, the condition is caused by an injury. In other cases, the condition is a result of a muscle, nerve, or connective tissue disease.

Medical Reference Manual: Disorders of the Connective Tissue

Connective tissues are made of proteins and fats. They support your body's organs and give your tissues their shape. Cartilage is an important connective tissue. It is stiff but more flexible than bone. Cartilage helps your bones move and glide over each other.

It also gives shape to body parts such as your nose and ears.

Connective tissue may be damaged by injury or through an infection. It can also be damaged by a large number of genetic disorders that occur rarely in the population.

A few of them are described below.

Ehlers-Danlos syndrome

Ehlers-Danlos syndrome refers to a collection of related disorders that weaken connective tissues. Symptoms can be mild to life threatening. They include the following:

- heart valves that leak**
- weakened blood vessels**
- loose joints**
- abnormal wound healing**
- soft, stretchy skin that bruises easily**
- muscle weakness**
- joint dislocations**

Ehlers-Danlos syndrome is an inherited disorder. Treatment involves managing symptoms and learning how to protect the joints and prevent injuries.

Scleroderma

Scleroderma is a group of related disorders involving abnormal growth of connective tissue. One

type of scleroderma affects only the skin. Another type can also affect other body systems. The cause of scleroderma is not known. It is more common in females than males. Other symptoms may include the following:

- calcium deposits in connective tissues**
- narrowing of blood vessels in the hands and feet**
- swelling of the esophagus (tube between the throat and stomach)**
- thick, tight skin on fingers**
- red spots on hands and face**

Treatment involves managing the symptoms.

Copyright © 2011 BSCS.

Master 3.9

Permission granted for classroom use.

(Page 1 of 2)

Marfan syndrome

Marfan syndrome is a disorder of connective tissue that is due to mutations in a gene that codes for a connective tissue protein called fibrillin. Symptoms can be mild to severe. Often, people with Marfan syndrome are tall and thin and have loose joints.

Their fingers and feet may be unusually long. Other symptoms may include the following:

- heart valves that leak**
- heart murmur**
- weakened blood vessels**
- curvature of the spine**
- flat feet**
- sudden lung collapse, sometimes asthma**
- nearsightedness and problems with the eye lens**
- stretch marks on the skin**
- teeth that are crowded together**

Marfan syndrome is an inherited disorder. Treatment involves managing symptoms and adopting physical activity guidelines that are specific to each person.

Osteogenesis imperfecta

Osteogenesis imperfecta is an inherited disorder that causes bone weakness. The disorder is caused by mutations to a gene involved with making the protein collagen.

Sometimes, bones break for no apparent reason. Symptoms can be mild to severe.

Other symptoms may include the following:

- muscle weakness**
- curvature of the spine**
- loose joints**
- hearing loss**
- skin that bruises easily**
- brittle teeth**

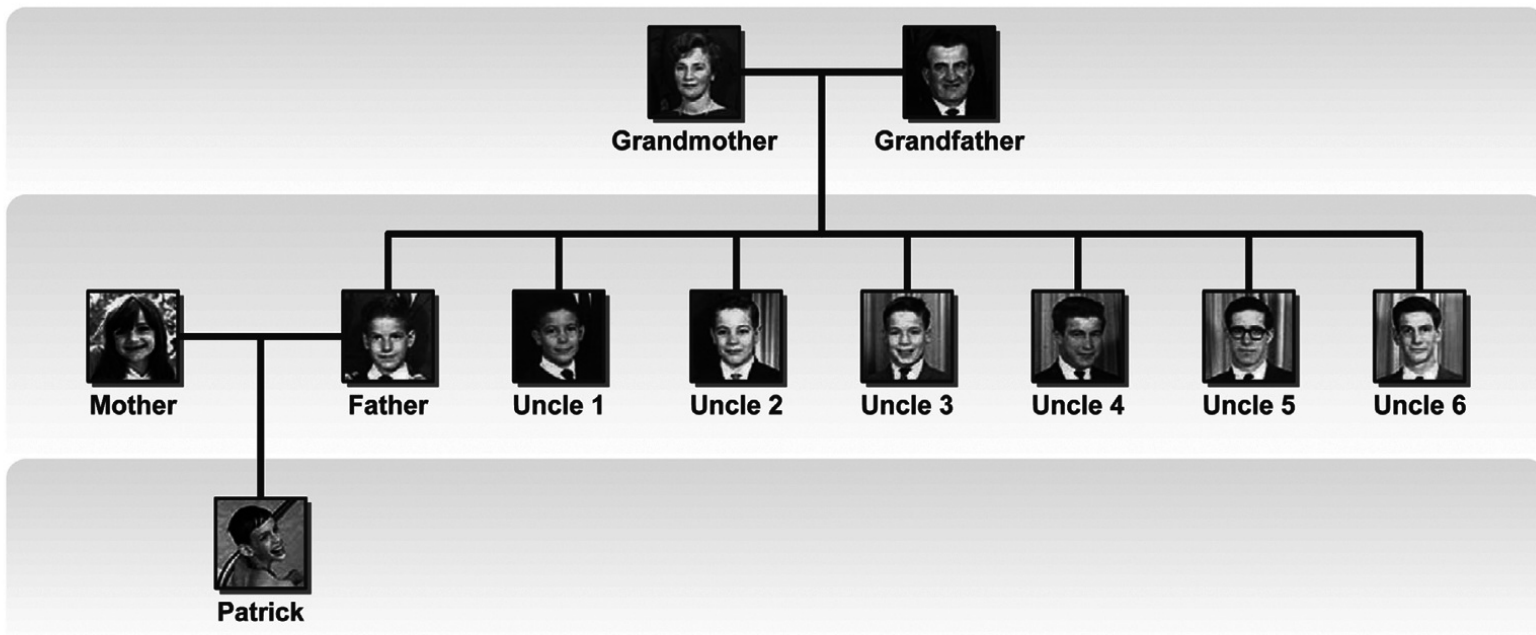

Treatment involves exercise, physical therapy, braces, and surgery.

Living with Marfan Syndrome

Questions to a doctor from young people who have Marfan syndrome

- 1. “Is there any possible way for the Marfan gene to be detected before a child is born and maybe find a way to prevent it from mutating itself?”**
- 2. “When they measured my heart with the echocardiogram, they told my mom they don’t think I should do marching band. I was wondering, if I don’t exert myself too much, if I take it at my own pace, do you think I could do it?”**

Comments from those young people about the most frustrating part of having Marfan syndrome

- 1. “The most frustrating thing for me is ... I can’t drive. I tried to get my permit, and I couldn’t pass the vision test because I did have my retina detached.”**
- 2. “The thing that frustrates me the most is all the aches and pains in my joints and sternum.”**
- 3. “When it comes to how you’re socially accepted, high school is really lame. In a couple of years, it’s not going to matter what sport you played or anything. It is going to matter what you know and what you do with the knowledge that you know.”**

Doctor Visits 1 and 2

Background

Jason and Kim are the parents of a five-year old girl, Hanna. They are concerned because she has had flu-like symptoms for three weeks and has not responded to treatment. The family doctor was concerned that something more serious than flu might be responsible for Hanna’s symptoms. He referred Hanna to another doctor for further examination.

First visit

The doctor examined the child and immediately noticed that she had signs of an infection. She felt the child’s abdomen and observed that the liver appeared to be swollen. The doctor asked the parents about their daughter’s health and the health of the rest of the family. Finally, she ordered

some blood tests.

Second visit

During the follow-up visit, the doctor explained that the results of the blood tests showed there was a problem. The doctor explained that Hanna had developed a cancer of the blood called leukemia. Jason and Kim were understandably upset to hear this news. The doctor further explained the nature of the disease and how it would be treated. She told them that childhood leukemia such as Hanna's is treatable. About 80 percent of children with leukemia are cured after treatment.

Evaluating Internet Search Results

Name(s):

Questions

1. Hanna’s parents searched the Internet because they wanted to find information about childhood leukemia. They wanted to answer such questions as

- What causes leukemia?**
- What are its symptoms?**
- How is it diagnosed?**
- How is it treated?**
- How likely is it that the treatment will help?**

2. When thinking about the results of an Internet search, for each hit, ask yourself:

- Is this site likely to contain the information that I want?**
- Is this site likely to contain information that is accurate?**

3. The Internet search returned the eight hits on your handout. Rank each hit in the table below by placing its number in one of the boxes. The most helpful hit is on the left side, and the least helpful hit is on the right side.

Karyotype

A karyotype is a photograph of a person's complete set of chromosomes.

A healthy human karyotype shows 22 pairs of numbered chromosomes (arranged by size), where one member of each pair comes from the mother and the other comes from the father.

There is an additional pair called the sex chromosomes. An individual with one X

chromosome and one Y chromosome is male. Someone with two X chromosomes and no Y chromosome is female.

What is the sex of the person whose karyotype is above?

Another Doctor Visit

Jason and Kim returned to the doctor's office with Hanna to discuss her treatment. The doctor suggested having Hanna participate in something called a clinical trial. She explained that a clinical trial is a process in which groups of patients receive treatments that differ in one feature of their treatment.

Jason and Kim were alarmed at this suggestion. They asked,

- “Does this mean that you don't know what to do for her?”
- “Do you mean that Hanna may receive a sugar pill instead of a real drug?”

The doctor replied that for decades, most children with leukemia have participated in clinical trials. The results from these clinical trials have helped greatly improve survival rates. The doctor further explained that, during a clinical trial, patients are never given a sugar pill because effective treatment options are available. Instead, a control group of patients receives the standard therapy while another group of patients receives some experimental treatment.

Treating Leukemia

Treatments for childhood leukemia in 1970

Standard treatment: Chemotherapy

The standard treatment for childhood leukemia uses three drugs taken together.

This combination of drugs and their doses have been guided by the results of many clinical trials:

- Drug A is prednisone. Cells have the ability to kill themselves if they become damaged. This helps keep the body free of unhealthy cells. Prednisone works by helping the body kill damaged white blood cells.

Side effects: Increased appetite, indigestion, and nervousness

- Drug B is vincristine. When cells divide, each new cell must receive an identical set of chromosomes. Vincristine interferes with this process and stops white blood cells from dividing.

Side effects: Hair loss, constipation, and nerve damage

- Drug C is methotrexate. When cells divide, they need to make more DNA, RNA, and protein molecules. Cancer cells are dividing rapidly compared with normal cells. Methotrexate interferes with the ability of all cells to make DNA, RNA, and proteins.

Side effects: Stomach pain, shortness of breath, and blood in urine

Central nervous system treatment

Doctors observed that often after chemotherapy treatment was stopped, leukemia reappeared in the central nervous system (brain and spinal cord). To kill cancer cells

“hiding” in this part of the body, the patient’s head is exposed to X-rays and the drug methotrexate is injected directly into the spinal fluid.

Side effects: Learning problems and increased risk for heart disease

Information about Leukemia

Federal Center for Cancer Research

Leukemia: A cancer of the white blood cells. White blood cells associated with leukemia are abnormal, and they are produced in very high numbers. Although it is a rare disease, leukemia can affect both children and adults. One type of the disease can appear in a short period of time (days to weeks), while another type of the disease develops more slowly.

Disease symptoms catalog

Leukemia

- **Too few red blood cells and platelets**
- **Repeated infections by viruses and bacteria**
- **Pain in the joints**
- **Pain in the abdomen**
- **Wheezing and coughing**

Diagnosing leukemia

Diagnosis of leukemia begins with a physical examination of the patient.

The doctor will

- **look for signs of infection, such as runny nose, fever, and cough;**
- **feel the abdomen to see if the liver or spleen is enlarged;**
- **take a medical history that involves questions about**

– patient

symptoms,

– family health, and

– medications and allergies; and

- **order blood tests to measure the numbers of white blood cells, red blood cells, and platelets.**

If the physical exam and blood test results suggest the possibility of leukemia, then the doctor may order the following tests:

- **Bone marrow biopsy: A piece of bone marrow is taken from the back of the hip and checked for the presence of abnormal cells.**

• **Lymph node biopsy:** As with the bone marrow biopsy, a sample is examined for the presence of abnormal white cells. (Lymph nodes are found throughout the body and help trap and destroy viruses and bacteria.)

• **Lumbar puncture (spinal tap):** A sample of spinal fluid is removed and checked for the presence of abnormal cells. The presence of abnormal cells can indicate that leukemia has spread to the central nervous system.

Stem cell

Red blood cell

Platelet

White blood cell

American Blood Cancer Society

As an adult, your body will contain about 10 pints of blood. This precious fluid flows through thousands of miles of veins, arteries, and capillaries. Let's take a look at the three most-common types of cells found in the blood. First are the red blood cells.

They transport oxygen and nutrients to the body's cells. Second are the platelets. They help stop bleeding and repair wounds. Last, the white blood cells help protect against infection by viruses and bacteria.

Figure 1. Red blood cell.

Figure 2. Platelet.

Figure 3. White blood cell.

Red blood cells, platelets, and white blood cells are not made in the blood itself.

Instead, they are made in a spongy tissue called bone marrow found in the hollow portions of bones. The bone marrow produces cells called stem cells. The stem cells can divide to form red blood cells, platelets, and white blood cells, which enter the bloodstream, where they do their work.

Figure 4. A stem cell in the bone marrow can produce a red blood cell, a platelet, or a white blood cell.

(Page 2 of 3)

American Blood Cancer Society (continued)

Leukemia and stem cells

In leukemia, a stem cell becomes mutated and begins to produce unhealthy white blood cells in large numbers. Leukemia is a cancer of the stem cells that are responsible for making white blood cells. As a result, unhealthy white blood cells are produced in great numbers and crowd out the healthy white blood cells. This also causes fewer red blood cells and platelets to be made. When healthy white blood cells encounter bacteria in the blood, they engulf and destroy them. But unhealthy white blood cells produced due to leukemia are not able to attack and destroy invading bacteria.

Figure 1. A mutated stem cell produces another mutated stem cell as well many unhealthy white blood cells.

Interview with Hailey

INTERVIEWER: What was it like to go to a new high school after undergoing treatment for leukemia?

HAILEY: Being a freshman is hard already, but for me, it was even harder. After a year away, I didn't really fit in. I wasn't the same as the other kids. They were thinking about cars, cell phones, and dating. Some days, all I could think about was dragging myself to the next class without throwing up. It was strange; here I was, surrounded by 2,000 other people, and I felt more alone than I'd ever been in my entire life.

INTERVIEWER: So what happened?

HAILEY: Slowly, things started to change. I met new friends who made me laugh, and I reconnected with old friends I'd known since elementary school. My teachers helped me, too. Mr. Brinthom got me involved in theater, which made every day a new adventure. Dr.

Bradley and my other teachers helped me discover a love of learning, especially science.

INTERVIEWER: Now that you're through with your treatment, what has cancer taught you?

HAILEY: Having cancer changed me. I had a new purpose. I wanted to help other teens who were going through the same thing.

INTERVIEWER: How did you go about helping teens with cancer?

HAILEY: I started delivering gift bags to a local hospital. Some people noticed and started sending me money to keep going—and I got noticed by the Leukemia and Lymphoma Society. I was even awarded the Spirit of Tom Landry Award last year by Mrs. Landry herself.

INTERVIEWER: What are your plans for the future?

HAILEY: I want to devote my life to fighting cancer as a pediatric oncologist. In the meantime, I'm helping out at events like a fashion show just for cancer patients.

INTERVIEWER: What can the rest of us do?

HAILEY: You don't have to find the cure for cancer to help someone in your own community. Sometimes, you just have to be there. Just get involved and do something—big or small.

Guidelines for the Poster

The information on your poster should be written in clear sentences

in paragraph form.

Part I: Information about the Disease

- **What is the name of the disease?**
- **Is it a common or a rare disease?**
- **What are the disease symptoms?**
- **Who gets the disease?**
- **What causes the disease (and how do we know)?**
- **How is the disease treated?**
- **How might having the disease affect a person's**
- **ability to participate in normal activities?**
- **relationships with family, friends, classmates, and strangers?**

Part 2: Summary of a Clinical Trial or Research Study

- **What is the purpose of the clinical trial or research study?**
- **Describe how the clinical trial or research study was carried out.**
- **What were the results of the clinical trial or research study?**
- **What can you conclude from the evidence presented?**

Research Study on Marfan Syndrome

Figure 1. Mice with the Marfan mutation. (© Brandon Laufenberg | iStockphoto.com) 1.

Background

A drug called losartan is used to treat people with high blood pressure.

Many problems caused by Marfan syndrome, such as an enlarged aorta (blood vessel), are due to a substance that works as a signal between cells. If too many signals are sent, the aorta grows too big. When it becomes too big, it is weaker and tears more easily. Researchers wonder if a drug called losartan can block this substance and keep the aorta at the normal size. They are testing this drug first in mice with Marfan syndrome and then, they hope, in humans.

2. Study design

The study used three groups of mice:

Group 1: Healthy mice (without Marfan syndrome). They received no treatment.

Group 2: Mice with Marfan syndrome. They received no treatment.

Group 3: Mice with Marfan syndrome. They received the drug losartan.

After receiving the drug (or not) for six months, the amount of growth in the heart's aorta was measured.

Table 1. Marfan Study Results

Treatment group

Average amount of growth in aorta

Healthy mice (no drug)

0.20 millimeters

Marfan mice (no drug)

0.66 millimeters

Marfan mice (treated with drug)

0.18 millimeters

Clinical Trial on Childhood Leukemia

Figure 1. Combination drug therapy. (EyeWire)

Figure 2. Brain irradiation. (© Colleen Butler |

iStockphoto.com)

1. Background

Since the 1960s, children with leukemia have had their heads X-rayed to prevent brain cancer. This treatment has worked well. Survival rates of children with leukemia have improved. Unfortunately, this treatment can also harm the ability of the brain to carry out its job.

Using more than one drug at the same time also has helped improve survival rates of children with leukemia. Researchers wondered whether the careful use of multiple drugs could keep survival rates high without using X-rays.

2. Study design

Children were assigned to one of two groups:

Group 1: Received combination drug therapy alone.

Group 2: Received combination drug therapy along with brain irradiation.

Table 1. Childhood Leukemia Study Results

Treatment group

5-year survival rate

Drug combination therapy without brain irradiation

94 percent

Drug combination therapy with brain irradiation

93 percent

PEOPLE REALITY

Productions

A large, stylized handwritten signature in black ink that reads 'Vincent Shiffert'. The signature is written in a cursive, flowing style and is set against a light gray, semi-transparent background.

Another Letter from the Producer

Dear Principal:

I am pleased to learn that you are still interested in helping us develop our reality television show. We have been busy interviewing young people who have a rare disease, and we have selected a boy named Kevin to be the focus of the show.

Kevin has been diagnosed with a rare disease called Marfan syndrome. He is outgoing and loves sports, though recently he has had to give up playing because of his Marfan syndrome. Kevin has developed an interest in videography and has a real talent for it. He is eager to join the class and even wants to film parts of the show himself!

I will be bringing Kevin to the school sometime next month to meet you, your staff, and, most importantly, the students who will become his classmates. Of course, if you have any questions, please contact me.

Once again, thank you for your help with this project.

Sincerely,

Vincent Shifflett

Senior Producer
